Sutures are classified or described in various ways: (1) by the mode of apposition of the united surfaces or edges of the bones, as the *squamous* suture, the *hormonic* suture, the *dentate*, the *limbate*, etc. (see *synarthrosis*); (2) by the shape or position of the suture, as the *coronal*, *sagittal*, *lambdoid* suture (many of these sutures appear in the cuts under *cranium* and *skull*, and in most of the other skulls figured in this dictionary); (3) by the names of the two bones which are sutured, as the *frontoparietal*, *occipitoparietal*, *sphenoparietal* suture. See phrases following. (b) In *entom.*, the line along which the elytra of opposite sides meet and sometimes are confluent. (d) In *cephalopods*, the outline of the septa of the tetrabranchiates, which resemble in some respects the dentate sutures of the cranial bones. These lines are variously traced in different cases; when they are folded the elevations or saliences are called *saddles*, and the intervening depressions or reentrances are called *lobes*.

3. In *bot.*, the seam or line of junction between two edges, as between the component carpels

of a pericarp, there commonly marking the line of dehiscence.—4. In *surg.*: (a) The uniting of the lips or edges of a wound by stitching or stitches, or in some equivalent manner. (b) One of the stitches or fastenings used to make such a union of the lips of a wound.

See the adjectives.—**Ethmoidal suture**, *ethmosphenoid suture*, the articulations, respectively, of the ethmoid with the frontal and with the sphenoid bone.—**Falx suture**, suture by mere apposition of rough surfaces, as in the harmonic and squamous varieties; little used.—**Frontal suture**. (a) In *anat.*, the serrate suture between the right and left halves of the frontal bone. In adult man it is usually obliterated by condensation of the bones; when it persists, it continues the line of the sagittal suture down the middle of the forehead to the root of the nose. More accurately called *interfrontal suture*. (b) In *entom.*, same as *clypeal suture*.—**Frontoparietal suture**, the coronal suture.—**Frontosphenoidal suture**, the suture between the frontal and sphenoidal bones, chiefly the line of apposition of each orbital plate of the frontal with the corresponding orbitosphenoid.—**Genal suture**. It is noted for its irregular zigzag course and deep dentations, often including Wormian bones.—**Limbose suture**, a suture with beveled edges and toothed processes, as the coronal or frontoparietal of man.—**Mastoccipital suture**, the suture between the mastoid part of the temporal bone and the occipital.—**Mastoparietal suture**, the suture between the mastoid part of the temporal bone and the parietal; it is short and deeply dentated in man, and non-existent in most animals.—**Mental, metopic, nasal, neurocentral suture**. surg., a double interrupted suture drawn over a piece of bougie or quill at either end.—**Randohr's suture**, a form of suture used to unite a transversely divided intestine. The bones thus sutured with the frontal are the ethmoid and sphenoid in mid-line, and the nasal, lacrymal, malar, and superior maxillary on each side.—**True suture**, suture by indented borders of bones, as in the dentate, serrate, and limbose sutures. swallow² (swol'ô), *n.* [*<* ME. *swolowe*, *swolow*, *swolow*, *swolow*; < AS. *swolowe* = MD. *swolow*, *swolow*, D. *swolow* = MLG. *swale*, *swalike* = OHG. *swalawa*, MHG. *swalwe*, G. *schwalbe* = Icel. Sw. *swala* = Dan. *swala* = Goth. **swalbr* (not recorded), a swallow: orig. Teut. **swalgau*, perhaps = Gr. *ἀλκυών* (written also *ἀλκυών*, and erroneously associated with *αἰε*, sea), a kingfisher; see *halcyon*.] 1. A fissirostral oscine passerine bird with nine primaries: any member of the family *Hirundinidae*, of which there are numerous genera and about 100 species, found in all parts of the world. The leading species of swallows are the barn-swallows of the genus *Hirundo*, with long deeply forked tail having the lateral feathers elongated and linear toward their ends, and with lustrous steel-blue plumage on the upper parts, and more or less tufous plumage below. The common bird of Europe is *H. rustica*; that of America is *H. erythrogastra*. They are called barn-swallows because they usually build their nests of straw and mud on the rafters of barns. The house-swallow or martin of Europe is *H. domestica*, of a genus not represented in America. The purple martin of North America is a very large swallow, *Progne subis* or *P. purpurea*, the male of which is entirely lustrous steel-blue; several similar species of the same genus inhabit other parts of America. The most widely diffused species of the family is the bank-swallow or sand martin, *Clifforda* or *Cotile riparia*, common to both hemispheres, of a mouse-gray and white coloration, without luster, breeding in holes in banks. Cliff-swallows are several species of the genus *Petrochelidon*, found in various parts of the world. That of the United States is *P. lunifrons*, also called *republican swallow*, *mud-swallow*, and *caucus-swallow*. These build nests almost entirely of pellets of mud stuck together in masses on the sides of cliffs, under caves, etc. Rough-winged swallows are several forms of the genera *Psalidoprocne* and *Stelidopteryx*, as *S. serripennis* of the United States, having the outer web of the first primary serrate with a series of recurved hooks. It is of dull-grayish coloration, resembling the bank-swallow. The white-bellied swallow of the United States is *Tachycineta* or *Iridoprocne bicolor*, of a lustrous greenish-black above and snowy-white below. A still more beautiful related species is the violet-green swallow of western North America, *Tachycineta thalassina*. The Bahaman swallow, *Cathichedon cyaneriviridis*, is a beautiful swallow resembling the violet-green, with shagreen upper parts and white under parts, belonging to the Bahamas and rarely found in Florida. Swallows are mainly insectivorous birds (though some of them eat berries also), and usually capture their prey on the wing with great address. Their wings are long, pointed, and narrow-bladed, giving great buoyancy, speed, and extension of flight. The feet are small and weak, and scarcely used for progression, but chiefly for perching and clinging. The song is a varied and voluble twittering, but the American martin has a strong, rich, musical note. Swallows are in most countries migratory; and those of Europe and America have long been noted, not only for the extent, but also for the regularity, of their migratory movements. Each species has its regular time of appearing in the spring, which may be predicted with much confidence; it is, however, to some extent dependent upon the weather, or the general advancement or retardation of the opening of the season. In the autumn swallows are often governed in leaving their summer resorts by the approach of storms or cold weather, and they are thus to some extent weather prophets. Their modes of nesting are more variable than is usually the case among birds so intimately related in other habits and in structure; and swallows also show, to an extent unequaled by other birds, a readiness to modify their primitive nesting habits in populous regions. Thus the nidification of the seven species of swallows which are common in the United States shows four distinct categories: (1) holes in the ground, dug

by the birds, slightly furnished with soft materials; bank-swallow, rough-winged swallow; (2) holes in trees or rocks, not made by the birds, fairly furnished with soft materials; white-bellied and violet-green swallows and purple martin; (3) holes or their equivalents, not made by the birds, but secured through human agency, and

more or less furnished with soft materials by the birds; formerly no species, now six of the seven species fall excepting the bank-swallow, (4) nests elaborately constructed by the birds, plastered with natural or artificial surfaces, and loosely furnished with soft materials, the cliff-swallow and the barn-swallow, especially the former. The eggs of the swallows like wise differ more than is usual in the same family, some being pure white, others profusely spotted. Among species in the United States, two, the barn-swallow and the cliff-swallow, lay spotted eggs; the other five, whole-colored eggs. This difference is interesting, taken in connection with the mode of breeding, since it is the general rule with birds that hole-builders lay white eggs, and that nest-builders, especially those whose nests are elaborate and open, lay spotted eggs. See also cut under *bank-swallow*, *barn-swallow*, *cliff-swallow*, *house-swallow*, *rough-winged*, and *three-tailed*.

2. Some bird likened to or mistaken for a swallow. Thus, the swifts, *Cypseloides*, belonging to a different order of birds, are commonly unscientifically called as the chimney-swallow of the United States *Chaturus pelagicus*. Cf. AS. *hama* = G. *hahn*, etc., a cock, as related to *L. canere*, sing; see *hen*.] 1. A large lamellirostral palmiped bird, of the family *Anatidae* and subfamily *Cygninae*, with a long and flexible neck, naked lores, reticulate tarsi, and simple or slightly lobed hallux. The neck is usually held in a graceful curve while the bird is swimming; the inner flight-feathers are usually enlarged, and capable of being erected or set like sails to waft the bird over the water; and in most of the species the plumage of the adults is snow-white in both sexes. The young of the white species are usually grayish or brownish; they are called *cygnets*. Swans walk awkwardly on land, in consequence of the backward position of the legs, but their movements on the water are exceptionally graceful and stately. Hence they are very ornamental, and some of them have been kept from time immemorial in a state of domestication. Swans are chiefly herbivorous. The flesh is edible, and the plumage furnishes the valuable swan's-down. There are 5 or 10 species, found in most parts of the world, except Africa. The ordinary white swans fall into two groups—*Cygnus* proper, with a knob on the beak, and *Olor*, without a knob; the latter are also distinguished by the resonant quality of the voice, due to the convolutions of the windpipe in the cavity of the breast-bone. In Europe four kinds of swans are found: (1) the common "tame" or mute swan, usually seen in domestication, *C. gibbus* (by the rules of nomenclature also

on the wing (some feathers of which are curly), carmine and white bill, and red eyes; it is easily acclimatized, and is often seen in domestication. A gigantic fossil swan, or swan-like goose, from the bone-caves of Malta, is known as *Pelecanopus paleoceros*. The popular notion that the swan sings just before dying has no foundation in fact.

The jealous swan avenge his death that syneth.

Chaucer, *Parlement of Fowls*, l. 342.

2. In *her.*, a bearing representing a swan, usually with the wings raised as it carries them when swimming. It is therefore not necessary to say in the blazon "with wings indorsed." See below.—3. In *astron.* See *Cygnus*, 2.—**Black swan.** *an* something very rare, or supposed to be non-existent; a rare avi—used like "white crow" and some other apparent contradictions in terms. [The phrase arose at a time when only white swans were known.]

(b) See def. 1.—**Chained swan**, in *her.*, a swan represented with some kind of collar about its neck, to which a chain is secured, which may be either carried to a ring or staple, or passed in a curve over the bird's neck between its wings, or the like. The swan dually gorged and chained is the well-known badge of the Bohuns, adopted by the Lancastrian kings.—**Demi-swan**, in *her.*, a swan with only so much of the body showing as rises above the water when it is swimming, the wings either indorsed or expanded. **Order of the Swan**, a Prussian order founded by the elector Frederick II., Margrave of Brandenburg, in 1440, renewed by Frederick William IV., King of Prussia, in 1843. **Swan close**, in *her.*, a bearing representing a swan with the wings close to its side. **Wild swan**, any feral swan; specifically, *Cygnus ferax* (*C. americanus*), so called in distinction from the "tame" or mute swan. See def. 1.

Swartzia (swärt'si-ä), *n.* [*NL.* *Swartzia*, 1789, named after Olaus Swartz; born 1760, died about 1818, a Swedish botanist.] A genus of leguminous trees, of the suborder *Papilionacea*, type of the tribe *Swartzia*. It is characterized by a variously ruptured calyx, which is entire and roundish in the bud; a corolla usually consisting of a single broad corrugated banner-petal or sometimes wanting; numerous declined and curving stamens which are nearly or quite free; and a coriaceous or fleshy ovoid or elongated pod. There are nearly 60 species, natives of tropical America, except one which is African. The leaves are odd-pinnate or sometimes reduced to a single leaflet; the flowers are commonly borne in clustered or panicle racemes. They are mostly large forest trees yielding a very hard and durable timber. *S. tomentosa*, the panoco or palo santo tree of Guiana, becomes 60 feet high and 3 feet thick. Its bark, called *panoco-bark*, is a powerful sudorific, and yields a red juice which hardens into a blackish resin. *S. grandiflora*, of the West Indies and southward, a small tree or shrub known as *warajillo* *awarillo*, also yields a valuable and very heavy wood.

It is now classed with the *Papilionaceae*, but differs from their usual character in its numerous and separate stamens, and corolla not at all papilionaceous but composed of five nearly equal petals, or of a single broad one, or wholly without petals. From the tribe *Sophoreae*, its nearest ally, it is also distinguished by its calyx, which is closed and entire in the bud. It consists of 6 genera, of which *Swartzia* is the type, and includes about 70 species, mainly trees with pinnate leaves, natives of tropical Africa and South America, especially of Brazil. Five or six exceptional Brazilian species have usually only ten stamens, like the type of the order.

II. *n.* A believer in the theology and religious doctrines of Swedenborg; a New Churchman. Swedenborg held Rev. xxi, 2, "And I John saw the holy city, new Jerusalem, coming down from God out of heaven," to be a prediction of the establishment of a new dispensation, the initiation of which took place by the execution of the last judgment in the spiritual world in the year 1757, whereby man was restored to moral freedom by the restriction of evil infestations, the power of which had threatened its utter extinction. In proof of this belief, his followers point to the unparalleled spiritual and material progress of mankind since that date. They were first organized in London (where Swedenborg long resided) in 1788, under the name of the "Society of the New Church signified by the New Jerusalem," usually abbreviated to New Church. Professed Swedenborgians, though widely scattered, have never been numerous; but Swedenborg himself appears not to have contemplated the formation of a separate church, trusting to the permeation of his doctrines through the existing churches. Swedenborgians believe that this process is going on, and that thus the new dispensation is making its way independently of their own organization or efforts, and even without the conscious knowledge of most of those affected by it. Swedenborg considered himself the divinely appointed herald and expounder of this dispensation, being prepared for the office by open intercourse during many years with spirits and angels (all originally human beings), and with God himself, who revealed to him the spiritual or symbolic sense of the Divine Word (which the world had not previously been in a state to receive or apprehend), setting forth spiritual and celestial truths in every part through the correspondence of all material things with the spiritual principles, good or evil, of which they are the outgrowth and manifestation. This doctrine of correspondences is the foundation of his system, which he elaborated with uniform consistency in many volumes, all first published in Latin. In this correspondence consists the plenary inspiration of the Word which includes only the Pentateuch, Joshua, Judges, Samuel, Kings, the Prophets and Psalms, the four Gospels, and the Apocalypse; the other books of the Bible are valuable for instruction, but lack this divine character.

2. To move on or in water by natural means of locomotion, as an animal, many of which can so move, though the water be not their natural element, and swimming not their habit. The act is accomplished in many ways, by different movements of the body or of the limbs, or by various combinations of such motions. Man swims with the arms and legs, or with the legs alone, in an attitude and with an action most like that of the frog. Ordinary quadrupeds can swim with movements of the legs much like walking. Some of these are specially fitted for swimming without decided modification of structure, as the otter, the beaver, the muskrat, though often in these cases the tail takes some part in propelling or guiding the animal; other mammals, as the pinipeds, and especially the cetaceans and sirenians, swim more or less exactly like fishes, the propulsion being mainly from the movements of the tail and hinder part of the body, and the flippers or fins being mainly used for steadying the body or guiding the course. All such mammals swim under as well as on the water. Web-footed birds, and some whose feet are scarcely or not webbed, swim on or under water, chiefly by means of the feet; but many of them accomplish a kind of flight under water with the wings, and use the feet chiefly as rudders. Such is especially the case with penguins, whose wings are flipper-like; and with the dippers (*Cinclus*), which are thrush-like birds, and fly under water as they do in the air, without using their feet at all. Aquatic serpents swim with a wriggling or writhing motion of the whole body like that with which they crawl on land; in some of these, however, the tail is flattened to serve as a fin. (See *Hydrophile*, and cuts under *sea-serpent*, *Hydrophis*, and *Platyrus*.) Aquatic annous brachians swim with their legs alone, when adult; their larvæ (tadpoles), and all tailed brachians, swim like fishes, by movements of the hind part of the body and tail. Aquatic turtles swim with all four legs, and especially, in the cases of the marine forms, with their enlarged fore flippers. Nearly all crustaceans are aquatic, and swim with very variously modified limbs and tail, their natatorial organs being usually abdominal or postabdominal. (See *swimmeret*, *pleopod*, *chiripoda*.) Many insects swim by the movement of specially modified legs which serve as oars, or in the cases of larvæ by undulatory movements of the whole body; some swim only on their backs, and others float, walk, or run on the surface of the water. A few mollusks, with-

out shells, swim with an undulation of the body or of processes of the mantle, but their usual modes of swimming are unlike those of animals with ordinary limbs or tail; some swim by energetic flapping of bivalved shells, others by ejecting a stream of water through siphons, or by setting a sort of sail which wafts them over the water. Aquatic worms swim by wriggling the whole body, and also by the action of multitudinous parapods or cilia. Jellyfishes and comb-jellies swim by rhythmical pulsations of a swimming-bell, or of the whole body, assisted or not by the action of some special organs. Animals swim mainly by ciliary action, but also by changes in the shapes of their bodies, and in some cases by special formations. See *swimming-bell*, *bladder*, *fin*, *foot*.

Scott, Heart of Mid-Lothian, xxxi.

2. A mechanical device for shifting a moving body, or a current of electricity, etc., from one course or track to another. Specifically—(a) In railroads, in its simplest form, two parallel lengths of rails joined together by rods, pivoted at one end, and free to move at the other end, forming a part of the track at its junction with a branch or siding. The switch-rails rest on metal plates laid on the sleepers, and by means of a rod fastened to their free ends, can be moved sidewise. The ends of the next pair of rails and the ends of the first pair of the siding or branch are placed side by side, so that by the movement of the switch either pair may be brought in line with the track, and any car or engine passing the switch will be guided upon the rails to which the switch is directed. Such a switch may be used to connect several lines of rails. The objection to this form of switch is that a car moving on a track not connected with the switch is liable to be derailed by running off the open ends of the track. This has led to the adoption of safety-switches, of which there are various forms. One of the most common of these is the *split switch*, in which the ends of the rails, instead of being square, are drawn out (split) to a thin edge so as to lie close against the side of the next rail. The narrow rails used are flexible and are fitted with springs, so that in the event of a displacement of the switch the lateral pressure of the wheels will cause the points to move back and thus keep the wheels on the line, the points returning to their original position by the recoil of the springs. Another form of safety-switch is designed to keep unbroken the

track of the main line, so that the main-line rails are not cut at all. To use this form of switch the levers are moved, and the car rises on an inclined rail and passes over the main rails to the siding. A great number of devices have

Switches.

Section of fig. 1. *a, a*, main tracks; *b, b*, branch tracks, or sidings; *c, c*, single frogs; *c', c'*, double frogs; *d*, switch-bar or rod (that nearest the point is called the *front rod*); *e*, switch-stand, with butterfly-signal and lamp. In fig. 4 the switches are shown as arranged at a crossing for shifting a train from one track to another in either direction. The outer rails in point-switches are full rails and rigidly spiked to the ties, while the inner are movable and taper to a point (whence the term *split*, as applied to them, is derived). In stub-switches the rails are full, and the rails of the main track adjacent to the branch as well as the branch rails are rigid, while the movable rails are on that part of the main track which meets the branch. The double-slip switch is simply composed of four point-switches.

been invented to make switches more safe, to render them automatic (as at the terminus of a line where the engine is to be shifted to the other end of a train), to render them interlocking, so that no one switch of a system can be opened without locking all others, and to connect them with signals and annunciators. Switches in one yard are now commonly controlled by means of long levers with a central tower from which one switchman can see and control them all. (b) In *telegraph*, a device used to make or break a circuit, to join two lines of wire or a main wire with a branch wire, or to connect any telegraph, telephone, electric-light, or electric-signal wires in any manner. The most simple form of switch is a lever pivoted at one end and connected with one circuit, and, by its movement laterally, used to connect that circuit with one of several others. Another simple form, called the *plug*- or *peg-switch*, consists of a metal plug or peg that may be inserted in openings or spaces between metal rods connected with different circuits. The peg serves as a bridge to join different circuits. The peg may also be connected with a short piece of flexible wire, the wire serving as a bridge for the current. By moving the peg from place to place on the switchboard, the wire serves as a switch to divert the current from one line to another. See *switchboard*.

This origin, whatever its particular nature, would explain the fact, otherwise scarcely explicable, that the original application of the term is without record.] **I. n. 1.** A tale-bearer or informer in general.

North, tr. of *Plutarch*, p. 77.

The laws of Draco . . . punished it [theft] with death; . . . Solon afterwards changed the penalty to a pecuniary mulct. And so the Attic laws in general continued, except that once, in a time of dearth, it was made capital to break into a garden and steal figs; but this law, and the informers against the offence, grew so odious that from them all malicious informers were styled *sycophants*; a name which we have much perverted from its original meaning.

Turning something difficult in his mind that was not in the scholastic *syl-labus*.
Dickens, *Our Mutual Friend*, ii. 11.

2. In the *Rom. Cath. Ch.*, a summary statement and enumeration of the points decided by an act or decree of ecclesiastical authority; specifically, a catalogue formulating eighty heresies condemned by Pope Pius IX. in 1864, annexed to the encyclical letter *Quanta Cura*. See the quotation.

Its full title is: *A Syl-labus*, containing the Principal Errors of our Times, which are noted in the Consistorial Allocations, in the Encyclicals, and in other Apostolical Letters of our Most Holy Lord, Pope Pius IX. . . . It is divided into ten sections. The first condemns pantheism, naturalism, and absolute rationalism; the second, moderate rationalism; the third, indifferentism and latitudinarianism; the fourth, socialism, communism, secret societies, Bible societies, and other "pests of this description"; the fifth, errors concerning the Church and her rights; the sixth, errors concerning civil society; the seventh, errors of natural and Christian ethics; the eighth, errors concerning Christian marriage; the ninth, errors concerning the temporal power of the pope; the tenth, errors of modern liberalism. Among the errors condemned are the principles of civil and religious liberty, and the separation of Church and State.

syl-lepsis (si-lep'sis), *n.* [= F. *syl-lepsis*; < L. *syl-lepsis*; < Gr. *σύνληψις*, a taking or putting together, comprehension; < *σύνταξις*, take together; see *syl-lable*.] In *rhet.* and *gram.*: (a) A figure by which a word is used in the same passage both of the person to whom or the thing to which it properly applies, and also to

include other persons or things to which it does not apply properly or strictly. This figure includes zeugma and also the taking of words in two senses at once: the literal and the metaphorical, as in the following passage, where the word *swearer* is used in both senses. "The judgments of the Lord are true and righteous altogether; . . . sweeter also than honey and the honey-comb." (Ps. xix. 1, 10.) Also sometimes used as equivalent to *synecdoche*.

If such want be in sundrie clauses, and of severall congruities or sense, and the supply be made to serve them all, it is by the figure *Syllepsis*, whom for that respect we call the (double supply).

Puttenham, *Arte of Eng. Poesie*, p. 127.

(b) A figure by which one word is referred to another in the sentence to which it does not grammatically belong, as the agreement of a verb or an adjective with one rather than another of two nouns with either of which it might agree: as, *rex et regina beati*.

syl-leptic (si-lep'tik), *a.* [*< syllepsis* (-lept-) + *-ic*.] 1. Containing or of the nature of syllepsis. *Imp. Dict.*—2. Explaining the words of Scripture so as not to conflict with modern science.

syl-leptical (si-lep'ti-kal), *a.* [*< sylleptic* + *-al*.] Same as *syl-leptic*. *Imp. Dict.*

syl-leptically (si-lep'ti-kal-i), *adv.* By way of syllepsis. *Imp. Dict.*

syl-ler, *n.* See *syl-ler*.

Syl-lidæ (sil'i-lē), *n. pl.* [NL., < *Syllis* + *-idæ*.]

A family of errant marine worms, typified by the genus *Syllis*, and containing also the genera *Gruhea*, *Dujardinia*, and *Schmarddia*. Among these worms both sexes and sexless forms occur; and such hermaphroditism is associated with a mode of propagation by the spontaneous division of an asexual individual into two or more parts, which may severally become sexual persons. Many of the species are phosphorescent. See cut under *Autolytus*.

syl-li-dian (si-lid'i-an), *n.* A worm of the family *Syllidæ*.

Syllis (sil'is), *n.* [NL. (Savigny).] A genus of polychaetous annelids, typical in some systems of the family *Syllidæ*. *Autolytus* is a synonym.

syl-loge (sil'ō-gē), *n.* [*< Gr. σύνλογος*, a gathering, summary (cf. *σύντομος*, an assembly, discourse); < *σύνλογος*, gather together; see *syl-logism*.] A collection.

Of the documents belonging to the later period a very comprehensive though not quite complete *syl-loge* is given. *Encyc. Brit.*, XIII. 131.

syl-logisation, syl-logise, etc. See *syl-logization, etc.*

syl-logism (sil'ō-jizm), *n.* [Formerly also *syl-logism, syllogisme*; < ME. *syllogisme, syllogisme*; < OF. *syllogisme, syllogisme*, F. *syllogisme* = Sp. *silogismo* = Pg. *syllogismo* = It. *silogismo, syllogismo*; < L. *syllogismus*; < Gr. *σύνλογισμος*, a reckoning all together, a reasoning, a conclusion; < *σύνλογος*, bring together premises, infer, conclude, < *σύν*, together, + *λογίζεσθαι*, reason, < *λογος*, word, something spoken; see *Logos*.] 1. A logical formula consisting of two premises and a conclusion alleged to follow from them, in which a term contained in both premises disappears; but the truth of neither the premises nor the conclusion is necessarily asserted. This definition includes the *modus ponens* (which see, under *modus*), the formula of which is that from the following from an antecedent of a consequent, together with the antecedent, follows the consequent. This depends upon two principles—first, the principle of identity, that anything follows from itself; and, secondly, the principle that to say that from A it follows that from B follows C is the same as to say that from A and B follows C. Under the former principle comes the formula that the following from an antecedent of a consequent follows from itself, and this, according to the second principle, is identical with the principle of the *modus ponens*. But the syllogism is often restricted to those formulae which embody the *nota nota* (or maxim, *nota nota est nota rei ipsius*), which may be stated under the form—from the following of anything from a consequent follows the following of the same thing from the antecedent of that consequent. Under this form it is the principle of contraposition. The simplest possible of such syllogisms is like this: Enoch was a man; hence, since being mortal is a consequence of being a man, Enoch was mortal. All syllogisms except the *modus ponens* involve this principle. A syllogism which involves only this principle, and that in the simplest and directest manner, like the last example, is called a *syllogism in Barbara*. In such a syllogism the premise enunciating a general rule is called the *major premise*, while that which subsumes a case under that rule is called the *minor premise*. A syllogism whose cogency depends only upon what is within the domain of consciousness is called an *epithetory* (or *analytic*) *syllogism*. A syllogism which supposes (though only problematically) a generalizing character in nature is called an *ampliative* (or *synthetic*) *syllogism*. (See *epithetory inference* (under *inference*), and *induction*, 5.) Analytic syllogisms are either necessary or probable. Necessary syllogisms are either non-relative or relative. Non-relative syllogisms are either categorical or hypothetical, but that is a trifling distinction. They are also either direct or indirect. A direct syllogism is one which applies the principle of contraposition in a direct and simple manner. An indirect syllogism is either

minor or major. A minor indirect syllogism is one which from the major premise of a direct or less indirect syllogism and a consequence which would follow from its conclusion, infers that the same consequence would follow from the minor premise. The following is an example: All men are mortal; but if Enoch and Elijah were mortal, the Bible errs; hence, if Enoch and Elijah were men, the Bible errs. A major indirect syllogism is one which from the minor premise of another syllogism and a consequence from the conclusion infers that the same thing would follow from the major premise. Example: All patriarchs are men; but if all patriarchs had died, the Bible errs; hence, if all men die, the Bible errs. Such inferences may be much complicated. Thus, No one translated I am much mistaken; but if no mortals go to heaven, I am much mistaken; hence, if all who go to heaven are translated, I am much mistaken. To say that from a proposition it would follow that I err when I know I am right would amount to denying that proposition, and, conversely, to deny it positively would amount to saying that, if it were true, I should be wrong when I know I am right. A denial is thus the precise logical equivalent of that consequence. An indirect syllogism in which the contraposition involves such a consequence is said to be of the second or third figure, according as its indirection is of the minor or major kind. The fourth figure admitted by some logicians, depends upon contraposition of the same sort, but more complicated, like the last example. The first figure comprises, in some sects of logic, the direct syllogism only; in others, the direct syllogisms together with those which are otherwise assigned to the fourth figure. (See *figure*, 9.) The names of the different varieties, called *moods of syllogism*, are given by Petrus Hispanus in these hexameters:

Barbara; Celarent; Darii; Ferio; Baralip-ton;
Celantes; Dabitis; Fapesmo; Frisesomorum.
Cesare; Camestres; Festino; Baroco; Darapti;
Felapton; Disamis; Datisi; Bocardo; Ferison.

(See these words, and *moods*, 2.) Probable deductive syllogisms are really direct statistical inferences (which see, under *inference*). The following is an example: In the African race there are more female than male births; the colored children under one year of age in the United States at the time of the census of 1880 form a random sample of births of Africans; hence, there should be more females than males under one year of age among the colored population of the United States in 1880. The conditions of the validity of such a syllogism are two: first, the character forming the major term (here that of the relative numbers of females and males) must be taken at random—that is, it must not be one which is likely to be subject to peculiar uniformities which could affect the conclusion; second, the minor term, or sample taken, must be numerous and a random sample—that is not likely to be of a markedly different character from that which is general in the class sampled. The conclusion is probable and approximate—that is, the larger the sample is the smaller will be the probable error of the predicted ratio. Synthetical or ampliative syllogisms are indirect probable syllogisms. The major indirect probable syllogism is induction (which see). The following is an example: The colored children under one year of age in the United States in 1880 form a random sample of births of Africans; but if there ought to have been more males than females among those children, the colored population of the United States is very different from the bulk of Africans; hence, if in the African race in general there are more male than female births, the colored population of the United States is very different from the bulk of Africans. It must be remembered that an observation of a ratio is never exact, but merely admits some values and excludes others; its denial excludes the former, and admits the latter. The denial of a statistical rule is thus itself a statistical rule; and hence such forms as the following are indirect probable syllogisms: American colored children under one year of age in 1880 form a sample of African births; among these the females are in excess; hence, in African births generally the females are probably in excess. The minor indirect probable syllogism is hypothetical inference. (See *hypothetical*, 4.) Relative syllogisms are those which involve other than merely transitive relations. These were first studied by De Morgan, and afterward by an American logician, but were involved in much difficulty until another American student, O. H. Mitchell, furnished in 1882 the clue to their unravelment. Every relative syllogism has at its core a non-relative syllogism, but this is generalized in a peculiar way—namely, every relative term refers to two or more universes, which may be coextensive, or may be entirely unlike as universes of material things, of space, of time, of qualities, etc. A relative proposition refers to some or all of each of several universes, and the order of the reference is material. (See *proposition*, 3.) Transpositions, identifications, and diversifications are performed upon principles now clearly made out. An insight into the same principle in regard to relative syllogism is that the same premise may be repeatedly introduced with new effect. Among relative syllogisms are comprised all the elements of mathematical reasoning, especially the Fermatian inference, the syllogism of transposed quantity, and the peculiar reasoning of the differential calculus.

Many times, when she would make
A full good syllogism, I doted
That afterward there shall misdeed
Follow an evil conclusion.

2. Deductive or expiatory reasoning as opposed to induction and hypothesis—a use of the term which has been common since Aristotle.

Allow some principles or axioms were rightly induced, yet nevertheless certain it is that middle propositions cannot be deduced from them in subject of nature by *syl-labism*—that is by touch and reduction of them to principles in a middle term. Bacon, *Advancement of Learning*, ii.

sylyph (silf), *n.* [= *D. silphe*, *silfe* = *G. sylph* = *Dan. sylf* = *Sw. sylfe*, < *F. sylphe* = *Sp. silfo* = *Pg. sylpho*, < *NL. sylpha*, a factitious name, found in Paracelsus, appar. < *Gr. σίλφ*, a kind of beetle. Other names of elemental spirits (*nymph, gnome, salamander*) are taken from the *Gr.* only one (*nymph*) having such use in *Gr.*, the others being, like *sylyph*, arbitrary. The spelling *sylyph* (*NL. sylpha*), with *y* instead of *i*, seems to have been used to make it look more like *nymph*, and because to occultists and quacks like Paracelsus words spelled with *y* look more Greek and convincing. As *salamander*, orig. 'a kind of lizard supposed to live in fire,' was made, by an easy transfer, to mean 'a

spirit of fire,' and *gnome*, quite arbitrarily (see *gnome*?), was made to mean 'a spirit of earth,' so *sylyph*, orig. (in the *Gr. σίλφ*) 'a beetle or insect,' seems to have been taken as 'a light flying creature,' hence 'a spirit of the air.' According to Littré the name was based on an Old Celtic word meaning 'genius,' given in the Latinized plural forms *sylyphi*, *sylyphi*, *m., sylphæ, sylphæ, f.* 1. An imaginary being inhabiting the air; an elemental spirit of the air, according to the system of Paracelsus, holding an intermediate place between material and immaterial beings. Sylphs are male and female, have many human characteristics, and are mortal, but have no soul. The term in ordinary language is used as feminine, and often applied figuratively to a young woman or girl of graceful and slender proportions.

I should as soon expect to meet a nymph or a sylph for a wife or a mistress. *Sir W. Temple*.

2. In *ornith.*, one of various humming-birds with long forcinate tail: so called from their grace and beauty; as, the blue-tailed *sylyph*, *Cyananthus forficatus*. See *cut* under *sappho*. = *Syn. 1. Elf, Fay, etc.* See *faery*.

It occurs crystallized and massive, of a steel-gray to silver-white color and brilliant metallic luster. The crystals are often so arranged in parallel position on the rock surface as to resemble written characters: it is hence called *graphic tellurion* or *graphic gold*.

Sylvia (sil'vi-â), *n.* [*NL.* (Scopoli, 1769), also *Sylvia* (Cuvier, 1800), < *L. silva*, *sylva*, a wood, a forest.] 1. In *ornith.*, (a) A genus of small dendrostraf or turdoid oscine passerine birds, typical of the family *Sylviidae*; the warblers proper. This genus was originally constituted for a part of the Linnean genus *Motacilla*, and has been loosely used for several hundred small warbler-like birds of both hemispheres, now dissociated in different families. The name is commonly attributed to Latham (1790), but was first used by Scopoli in 1769. The type is now assumed to be the common whitethroat, *Motacilla sylvia* of Linnaeus, *Sylvia cinerea* of Bechstein, also called *S. rufa*; and the term is restricted to a few very closely related species of chiefly Palearctic warblers, of small size, with scutellate tarsi, bristled gape, twelve tail-feathers, axillaries never yellow, first primary spurious, and the bill strictly sylvine. Some of the leading species in this narrow sense are *S. nisoria*, the barred warbler; *S. hortensis*, the pettichaps or garden-warbler (see *cut* under *pettichaps*); *S. curruca*, the lesser whitethroat; *S. atricapilla*, the blackcap; *S. orphea*, the orphean warbler. These, like *S. cinerea*, are all found in Great Britain. No bird of this genus occurs in America, though most of the American warblers which were known to the older ornithologists were placed in *Sylvia*. (b) [*I. c.*] A warbler; a species of the genus *Sylvia*, or some similar bird. — 2. In *entom.*: (a) A genus of dipterous insects. *Desrois*, 1830. (b) A genus of arachnids. *Gervais*, 1849.

II. *n.* One of the warblers; a member (a) of the genus *Sylvia* or family *Sylviidae* of the Old World, or (b) of the family *Mniotiltidae* of America. See these words, and *warbler*.

Sylvian² (sil'vi-an), *a.* [*< Sylvius* (see *def.*) + *-an*.] Relating or named from the anatomist Jacques Dubois, Latinized *Sylvius* (1478–1555): specifically applied in anatomy to several parts. — **Sylvian aqueduct**. See *aqueductus Sylvii*. — **Sylvian artery**, the middle cerebral artery, lying in the Sylvian fissure. — **Sylvian fissure** or **sulcus**. Same as *fissure of Sylvius* (which see, under *fissure*). It is the most marked and persistent of all the fissures, recognizable in some animals the surface of whose cerebrum is otherwise perfectly smooth; in man it is very deep, and incloses the island of Reil, or insula constituted by the gyri operi. The name is sometimes restricted to the posterior or horizontal branch of the fissure, or that part which is commonly present in other animals than man. — **Sylvian ventricle**, the camera, pseudocoele, or so-called fifth ventricle of the brain.

sylvic (sil'vik), *a.* [*< L. silva*, less prop. *sylva*, a wood, forest, + *-ic*.] Pertaining to or derived from wood. — **Sylvic acid**, one of the acids obtained from colophony: same as *abietic acid*. See *abietic*.

In *conch.*, a genus of pulmonate gastropods, of the family *Helicidae*. *Humphreys*, 1797. — 3. In *ornith.*: (a) A genus of American warblers, proposed by Swainson in 1827, for many years in use, and giving name to the family *Sylvicolidæ*. It was based upon the blue yellow-backed warbler, *S. americana*, subsequently made the type of the genera *Chloris* (Boie, 1826), *Parula* (Bonaparte, 1838), and *Compsothlypis* (Ahnaiis, 1850), and generally applied to the species of *Dendroica* and some related genera before the recognition of the fact that the name was preoccupied. It fell into disuse about 1842, and the name of the family has since been changed to *Mniotiltidae* or *Dendroicae*. See these family names. The limits of the family, like those of its representative genus, have fluctuated widely, and no exclusive diagnosis is practicable. As compared with *Turdidae*, the *Sylviidæ* differ in the usually unspotted plumage of the young birds, which differ little from the adults. Compared with *Muscicapidae*, the *Sylviidæ* lack the breadth and flatness of the bill which characterize the true flycatchers, and the great development of the rictal bristles. The family is very widely distributed in the eastern hemisphere, but is scarcely represented in America, where the birds formerly classed as *Sylviidæ* are, with very few exceptions, *Mniotiltidae*, having but nine primaries and being otherwise quite different. The *Sylviidæ* include many modern genera, and are variously subdivided. In one classification they are made to consist of 7 subfamilies — *Dryocorinae*, *Calamoherpinae*, *Phylloscopinae*, *Sylviinae*, *Rubricollinae*, *Saxicolinae*, and *Accentorinae*. Proportionality; commensurability; the due proportion of parts; especially, the proper commensurability of the parts of the human body, according to a canon; hence, congruity; beauty of form. The Greek word *συμμετρία* was probably first applied to the commensurability of numbers, thence to that of the parts of a statue, and soon to elegance of form in general.

2. The metrical correspondence of parts with reference to a median plane, each element of geometrical form having its counterpart upon the opposite side of that plane, in the same continued perpendicular to the plane, and at the same distance from it, so that the two halves are geometrically related as a body and its im-

Cf. *apathy*, *antipathy*.] 1. Feeling identical with or resembling that which another feels; the quality or state of being affected with feelings or emotions corresponding in kind if not in degree to those which another experiences; said of pleasure or pain, but especially of the latter; fellow-feeling; commiseration; compassion. In writers not quite modern an occult influence of one mind (or body) by another is meant, but this meaning is now almost forgotten.

This is by a natural *sympathie* between the eare and the eye, and between tunes & colours.

Pattenham, *Arte of Eng. Poesie*, p. 70.

In order to awaken something of sympathy for the unfortunate natives. *Burke*, *Fox's East India Bill*.

The word *sympathy* may also be used on this occasion, though the sense of it seems to be rather more extensive. In a good sense, it is styled benevolence; and, in certain cases, philanthropy; and, in a figurative way, brotherly love; in others, humanity; in others, charity; in others, pity and compassion; in others, mercy; in others, gratitude; in others, tenderness; in others, patriotism; in others, public spirit.

Bentham, *Introduct. to Morals and Legislation*, x. 25.

Although we commonly have in view feeling for pain rather than for pleasure when we talk of *sympathy*, this last really includes both.

J. Sully, *Outlines of Psychology*, p. 510.

It is true that *sympathy* does not necessarily follow from the mere fact of gregariousness. Cattle do not help a wounded comrade; on the contrary, they are more likely to dispatch him.

W. James, *Prin. of Psychology*, II. 210.

2. An agreement of affections or inclinations, or a conformity of natural disposition which makes two persons agreeable each to the other; mutual or reciprocal inclination or affection; sympathetic interest: in this sense commonly followed by *with*: as, to have *sympathy with* a person in his hopes, aspirations, or aims.

Priscilla's silent *sympathy* with his purposes, so unalloyed with criticism, and therefore more grateful than any intellectual approbation, which always involves a possible reserve of latent censure.

3. In *physiol.* and *pathol.*: (a) That state of an organ or a tissue which has a certain relation to the condition of another organ or tissue in health and disease: a related state of the vital manifestations or actions in different organs or tissues, such that when one part is excited or affected others are also affected; that relation of the organs and parts of a living body to each other whereby a disordered condition of one part induces more or less disorder in another part: as, for example, the pain in the brow caused by taking a draught of cold water into the stomach, the pain in the right shoulder arising from disease of the liver, or the irritation and vomiting produced by a tumor of the brain. (b) The influence which the physiological or pathological state of one individual has in producing the same or an analogous state in another at the same time or in rapid succession, as exemplified in the hysterical convulsions which affect a number of women on seeing one of their companions suffering from hysteria, or the yawning produced by seeing an

other yawn.—4. Physical action at a distance (so used by old writers against astrology, who argue that the influence of the stars is not physical sympathy and not moral sympathy, and therefore does not exist at all): as, the *sympathy* between the lodestone and iron.

What we call *sympathies* and antipathies depending indeed on the peculiar textures and other modifications of the bodies between whom these friendships and hostilities are said to be exercised, I see not why it should be impossible that there be a cognation betwixt a body of a congruous or convenient texture and the effluvia of any other body. *Bayle*, *Hidden Qualities of Air*.

5. In *acoustics*, the fact, condition, or result of such a relation between two vibratile bodies that when one is thrown into vibration the other tends to vibrate in a similar or related way, in consequence of the vibrations communicated to it through the air or some other medium.—**Powder of sympathy.** See *powder*.—**Syn.** 1. *Commiseration*, *Compassion*, etc. (see *pity*); *tenderness*.—2. *Affinity*, *harmony*.

Dan. *synagoge* = Sw. *synagoga*, < LL. *synagoga*, < Gr. συναγωγή, a bringing together, a collecting, collection, in LXX and N. T. an assembly, synagogue, < συναγειν, gather or bring together, < σῖν, together, + ἀγειν, drive, lead; see *agent*.] 1. An organization of the Jews for the purposes of religious instruction and worship.

The term *synagogue* (like our word church) signifies first the congregation, then also the building where the congregation meet for public worship.

Schaff, Hist. Christ. Church, I, § 51.

2. The building where such instruction and worship are maintained. The synagogue first came into prominence in the religious life of the Jewish people during the exile, and, since the destruction of the temple and the dispersion of the Jews, constitutes their customary place of worship. The organization of the synagogue consists of a board of elders presided over by a ruler of the synagogue (Luke viii 41, xiii 14). The worship is conducted according to a prescribed ritual, in which the reading of the Scripture constitutes a prominent part. Formerly the officers of the synagogue exercised certain judicial functions, and the synagogue itself was the place of trial (Luke xii 11, xvi 12), but this is no longer the case.

There beside was the *Synagogue*, where the Bysschoppes of Jewes and the Pharysees came to gader, and helden here Conscience. *Manderillo, Travels*, p. 93.

3. An assembly of Jewish Christians in the early church.

If there come into your *synagogue* a man with a gold ring, in fine clothing, . . . and ye have regard to him that weareth the fine clothing, . . . are ye not . . . become judges with evil thoughts? *Jas. ii. 2* (R. V.).

Hence—4. Any assembly of men. [Rare.]

A *synagogue* of Jesuits. *Milton. (Imp. Dict.)*

synalephe, synalœphe (sin-a-lœ'fô), *n.* [= *F. synalœphe*, *< L. synalœphe*, *< Gr. συναλοήφω*, the contraction of two syllables into one, *< συναλειφω*, smear together, smooth over, unite, *< συν*, together, + *αλειφω*, anoint.] The blending of two successive vowels so as to unite them in one syllable, as by syneresis, synizesis, crasis, so-called elision, or a combination of these; especially, the obscuration or suppression of a final vowel-sound (vowel or diphthong) before an initial vowel-sound, as in *th' enemy* for *the enemy*. Usually, as in the instance just given, the final vowel is only obscured, not suppressed, being audible. When the final vowel is entirely suppressed, as in French *l'amour* for *le amour*, there is no longer a true blending or synalephe, but the term has been extended to include such cases. What is commonly called *elision* is usually synalephe or blending, not ethlipsis or suppression.

I have named the *synalepha*, which is the cutting off one vowel immediately before another.

The tail is fitted for climbing and scrambling about in trees and bushes, as in the creepers, and the feet are strongly prehensile, with large curved claws. They are small birds (a few inches long), but build huge coarse nests, sometimes 2 or 3 feet in diameter, or as large as a barrel, of sticks and twigs loosely thrown together, in the recesses of which the eggs are laid upon a nest proper of soft substances. There is great uniformity in the eggs, which are of a white or pale bluish color. The subfamily is also called *Anabatinae*.

The calcareous concretions of the integument which form a hard shell or test in most echinoderms are here reduced to certain flat perforated plates here and there, to which anchorate hooks or anchor-shaped spicules are attached, forming very characteristic structures. (See *cuts at uncora*, *Holothuriidae*, and *Synaptidae*.) There are several species. *S. digitata* is British. *S. girardi* is common on the Atlantic coast of the United States, living in the sand at about low-water mark. This word first passed into common use at the Reformation, and was then used indifferently, in both a good and a bad sense, to designate the attempted union of different sects on the basis of tenets common to all. The word has somewhat varied application to certain embryonic formations and to some adult tissues, as striped muscular fiber, certain parts of sponges, etc.

The ectoderm [of a calcareous sponge] is a transparent, slightly granular, gelatinous mass in which the nuclei are scattered, but which, in the unaltered state, shows no trace of the primitive distinctness of the cells which contain these nuclei, and is therefore termed by Haeckel a *syncytium*. *Huxley, Anat. syngenesis (sin-je-nē'-sis), *n.* [NL., < Gr. *syn*, together, + *γενεῖς*, generation.]

Reproduction in which a male and a female take part, one furnishing spermatozoa and the other an ovum, so that the substance of the embryo is actually derived from both parents. This is the rule, perhaps without exception, in sexual generation, and opposes the view of the spermists, that the embryo comes from the male element, for the development of which the female furnishes only the nidus, and that of the oovists, that the embryo is derived entirely from the female, the male principle affording only the requisite stimulus to development. As a doctrine or theory, one form of syngenesis supposes every germ to contain the germs of all generations to come, and is opposed to *epigenesis*.

The theory of *syngenesis*, which considers the embryo to be the product of both male and female, is as old as Empedocles.

G. H. Lewis, Aristotle, p. 263.

Growth, therefore, was, on this hypothesis (of Buffon's), a process partly of simple evolution, and partly of what has been termed *syngenesis*. Huxley, *Evol. in Biol.*

(Cf. *exode*, *exodus*.)] 1. An assembly of ecclesiastics or other church delegates duly convoked, pursuant to the law of the church, for the discussion and decision of ecclesiastical affairs; an ecclesiastical council. Synods or councils are of five kinds — ecumenical, general, national, provincial, and diocesan. For definition of their several characteristics, see *council*, 7.

Why should you have a *Synod*, when you have a Convocation already, which is a *Synod*? Selden, *Table-Talk*, p. 108.

Twice a year, in accordance with the canonical institutions of Christian antiquity, had it been ordered of old in an English Council that every bishop and his priests should meet together in *synod*; the common form of proceeding which was used in these early clerical gemotes is believed to be still extant. R. W. Dixon, *Hist. Church of Eng.*, xix.

In the former case the presbyteries of the whole church are grouped into synods, each of which comprises all the parishes or congregations of a particular district. The members of the synod are in most cases the members of all the presbyteries within its bounds; but in some churches the court is composed of delegates from the presbyteries.

3. A meeting, convention, or council.

Holy Governing Synod (of all the Russias), a synod which is the highest ecclesiastical authority in the Russian Church. It consists of several metropolitans and other prelates and officials — the chief procurator of the synod representing the czar. It was instituted by Peter the Great in 1721, to supply the place of the patriarch of Moscow. The last patriarch had died about 1700, and Peter would not allow the appointment of a successor,

thinking the power of the patriarchal office too great. The orthodox national church of the kingdom of Greece is also governed by a synod of archbishops and bishops, independent of any patriarch.—**Mixed synod**, a synod composed of clergy and laity.—**Robber synod**. Same as *Latrocinium*, 2.

synonym (sin'ō-nim), *n.* [Also *synonymum* (formerly also, as *L.*, in plural *synonyma*, sometimes used as an *E.* singular); *< F. synonyme* = *Sp. sinónimo* = *Pg. sinónimo* = *It. sinonimo*, *< L. synonymum*, *< Gr. synonoma*, a word having the same meaning with another, neut. of *synonoma*, having the same name or meaning, *< syn*, together, + *onoma*, name; see *onym*.] *Cf. antonym, antonym, homonym, etc.* 1. Trinch, Study of Words, p. 173.

2. A word of one language which corresponds in meaning with a word in another language. See *heteronym*, 2, *paronym*, 2, and the quotation from Camden under *synonymize*.—3. In *nat. hist.*, a systematic name having the same, or approximately the same, meaning or application as another which has superseded it; a technical name which, by the rules of nomenclature, is not tenable. The question of the acceptance of a generic or a specific name depends upon the law of priority. (a) Botanists take 1753, the year of the publication of Linnaeus's "Species Plantarum," as the starting-point for both genera and species, since in this publication binomials were for the first time systematically adopted. The naming of a botanical species consists in conferring upon it two appellations, a generic and a specific; and adequate publication consists in issuing a printed diagnosis sufficient to identify the plant with certainty. The earliest name conferred after the above date is the name by which, according to the law of priority, the plant must be known, providing, of course, that the classification is correct; and it is held that a strict adherence to this rule is essential in order to a stable systematic nomenclature. Since plants have often been placed in a wrong genus, the question arises whether the absolutely first specific name is to be retained, or the first that was used with the right genus name, the former is the accepted alternative. The names thus discarded are called *synonyms*, though in a broader sense all the names from which the selection is made are synonyms. On account of unsettled usage synonyms must often be quoted. In obedience to the law of priority, Nuttall's name *Corymbus*, by which the hickory has been known since 1818, becomes a synonym of *Hicoria*, the earlier name of *Rathesque*.

Synonyma gives way to *Castalia*; *Adiantum cirrho-a* of Kuhn to *Adiantum* of Alton, *Trochilidæ Americanæ* of Muller to *T. latus* of Salisbury, etc. (b) Zoologists usually adopt different dates as the starting-point. In England and on the continent of Europe this is generally 1758, the date of the twelfth edition of the "Systema Naturæ" (with an express exception in favor of the genera not the species) of Linnæus, 1760. American zoologists nearly all start from 1758, the date of the tenth edition of the work named. This difference of dates is the chief incompatibility of two schools which have become known as the *English* and the *American*, neither of which has thus far yielded the point to the other. The former school contends that 1758 is the date of the last edition of the "Systema," revised by the author himself to present the completion of the Linnaean binomial system in zoology, the earlier editions having been but provisional or tentative; the latter school maintains that 1760 is the date when that system was first formally and consistently applied to zoology. In practice the whole matter of synonymy is extremely complicated by various considerations other than the single question of priority in any given case—as for example, the adequacy or exclusive pertinence of the diagnosis upon which a name rests; recognizability of a description; acceptance of a name in a wide or a narrow sense by different authors; transference or cross-use of a name by different authors; erroneous identification and consequent wrong applications of a name; rejection of a name for one of several different reasons and introduction of another name in its stead; the question whether use of a name in botany precludes its subsequent use in zoology (and conversely); the question whether the same name can be an onym in more than one of the numerically enormous orders of insects; and, particularly, the biological question as to whether necessarily of expert opinion of what constitutes a genus, species, subspecies, etc. To all the above considerations (besides which various others could be added) is to be added especially, in accounting for the vast number of synonyms which encumber zoological nomenclature, the incessant redescription and renaming of species and genera in ignorance of the fact (or ignoring the fact) that they had been named before, or mistaking them for valid when they are not. One singular class of synonyms is merely verbal, arising from corrections of malformed words, which, when properly respelled, are seen to be literally identical with other names from which they had appeared different by the misspelling; and with this class of synonyms is related another, arising from a mere difference in termination (as of gender, for example, *Picus* and *Picea*), inflection, etc. (as *Synodus*, *Synodon*, *Synodontis*, *Synodontia*). Literal quibbles of this sort have proved so frequently vexatious that the American school has declared that a word must subsist precisely as originally printed, no matter how malformed or misspelled, unless a typographical error be manifest, and that any two words which are differently spelled are tenable as different names, if the distinction be anything more or other than mere chance of termination (as *us*, *a*, *um*, or *itis*, as distinguishing grammatical gender). Irrespective of the law of priority, and also of any such moot points as are above cited, the rules of nomenclature require (1) that no specific or sub-specific name shall be used twice in the same genus, and (2) that no generic name, or name of any higher group, shall be used twice in the animal kingdom. There is, thus, theoretically, but a single onym (tenable binomial designation) of every species, and a single onym of every genus or higher group—all other designations being in every case synonyms. Practically, however, the case is far from any such simplicity and uniformity; alternative technical names incessantly recur in the literature of zoology, and the synonymy of numberless species, genera, etc., is in almost inextricable confusion. The number of synonyms in zoology vastly exceeds that of theonyms; most species which have long been known have acquired a larger number of New Latin synonyms than of English names. Very many have been placed in a dozen or more different genera, and have been described under as many different specific names—the various combinations of which generic and specific designations are a third source of uncounted synonyms. Such uncertainty and inconvenience have resulted from all these nomenclatural vagaries that some zoologists do not hesitate to ignore the fundamental law of priority, and continue to call a species by the technical name by which it has been oftenest called already. Such consensus of the nomenclators has at least the advantage of presenting better-known names instead of less-known names.

4. A system of synonyms; a collection of synonyms; also, the study of synonyms; the use of synonyms in expressing different shades of meaning; the discrimination of synonyms; especially, in *nat. hist.*, the sifting of synonyms to determine the onyms. In botany and zoology the synonymy of a species of plant or animal, in the concrete, is a list of the several different names which have been applied to it by its various describers or classifiers, implying on the synonymist's part the discrimination not only of the synonyms of the species, but of the homonyms of related species, for the especial purpose of determining the onym of each species. Thus, *Falco fuscus* and *Falco obscurus* may be synonyms of one and the same species of falcon, yet *Falco fuscus* may be a homonym of two different species of falcon, and it may be that neither name is the onym of either of these species. Synonymy in natural history has become of late years so extensive and so intricate that probably no naturalist has mastered the subject beyond the line of some one narrow specialty. Synonymic lists for single species extending over several pages of an ordinary book are of no infrequent occurrence. See *synonymy*, 3.

The inconveniences arising from the want of a good nomenclature were long felt in Botany, and are still felt in Mineralogy. The attempts to remedy them by *Synonymies* are very ineffective, for such comparisons of synonyms do not supply a systematic nomenclature.

Yet the Tubingen professors and our Liberal newspapers must surely have something to go upon when they declare that the Jesus of the Fourth Gospel speaks quite differently from the Jesus of the *Synoptics*, and propound their theory of the gnostic philosopher inventing, with profoundly calculated art, his fancy Gospel.

M. Arnold, *God and the Bible*, vi. § 5.

synoptical (si-nōp'ti-kal), *a.* [*< synoptic + -al*.]

Same as *synoptic*.—**Synoptical table**, in *nat. hist.*, a tabular synopsis of the leading, generally the most striking or easily recognized, characters of any group in zoology or botany, whereby the group is exhibited with a view to the ready identification of a given specimen, or analyzed to illustrate the relationship of its several components to one another. Such tables often proceed upon the dichotomous plan of presenting in succession alternatives of two (or more) characters, only one of which the specimen in hand should exhibit, as the "ovary interior" and "ovary superior" in case of a plant; but the tabulation may be made in any way which best subserves the desired purpose in different cases. Some are natural analyses, others wholly artificial; the former are the more important and really instructive, the latter the most convenient and immediately helpful. Some combine these incompatible features as far as possible; and all are constantly used in systematic treatises, manuals, and text-books. They are often called *keys*.

It [speech] should carry an orderly and good construction, which they called *Synthesis*.

Pattenham, *Arte* of Eng. Poesie, p. 139.

Geometrical deduction (and deduction in general) is called *synthesis*, because we introduce, at successive steps, the results of new principles. But in reasoning on the relations of space we sometimes go on separating truths into their component truths, and these into other component truths, and so on; and this is geometrical analysis.

Whewell, *Philos.* of Inductive Sciences, II. xxiii.

Science turns her back on the subject, and the universities dismiss Art from the category of studies, and pass it over mainly to the painters to discourse on, ignoring the psychological law that no mind can be productively analytical and synthetical at the same time, and the artist, being perforce a *synthesist*, cannot be expected to analyse the art which he is, if a true artist, occupied in building.

New Princeton Rev., II. 21.

Most fossil types are synthetic in comparison with existent forms of which they are ancestral.—**Synthetic geometry**, geometry treated without algebra, or at least without coordinates; opposed to *analytical geometry*. 1. A portable hydraulic instrument of the pump kind, commonly employed to draw in a quantity of water or other fluid, and to squirt or eject it forcibly. In its simplest form it consists of a small cylindrical tube with an air-tight piston fitted with a rod and handle. The lower end of the cylinder terminates in a small tube; on this being immersed in any fluid, and the piston then drawn up, the fluid is forced into the body of the cylinder by the atmospheric pressure, and by pushing back the piston to the bottom of the cylinder the contained fluid is expelled in a small jet. The syringe is used by surgeons and others for washing wounds, for injecting fluids into the body, and for other purposes. A larger form is used for watering plants, trees, etc. The syringe is also used as a pneumatic machine for condensing or exhausting the air in a close vessel, but for this purpose two valves are necessary.

3. In *anat.*, the Eustachian tube.—4. In *ornith.*, the voice-organ of birds; the lower larynx, situated at or near the bifurcation of the trachea into the bronchi, and serving to modulate the voice, as in singing. This is usually a more complicated structure than the larynx proper (at the top of the trachea), and so differently constructed in different birds that it affords characters of great significance in classification. The highest group of *Passeres* (namely, the suborder *Oscines*, which contains the singing birds) is signalized by the elaboration of this musical organ, especially with reference to its intrinsic musculature. A few birds have no syrinx; some have one, yet without intrinsic muscles; in some the syrinxes are wholly bronchial, and consequently paired; in others the syrinx is wholly tracheal, and single. But in nearly all birds the syrinx is bronchotracheal, and results from a special modification of the lower end of the trachea and upper end of each bronchus. The lowermost tracheal ring, or a piece composed of several such rings, is enlarged and otherwise modified, and crossed by a bolt-bar (see cut under *passulus*), which separates the single tracheal tube into right and left openings of the bronchi. A median septum rises from the pessulus into the trachea, between the two bronchial orifices, and the free upper margin of this septum, called the *semilunar membrane*, forms the inner lip of a rima syringis, whose outer lip is a fold of mucous membrane from the opposite side of each bronchus. These membranes are vibratile in the act of singing, and constitute vocal cords. Several upper bronchial half-rings, enlarged and otherwise modified, are completed in circumference by a single continuous membrane, the *internal tympaniform membrane*, which is attached to the pessulus above. The syrinx is actuated by a pair, or several pairs, of intrinsic singing-muscles, called *syringomya*, which vary much in different birds in their attachments as well as in their number. (See *syring-muscle*.) In the *Oscines* at least five pairs are recognized, though their nomenclature is by no means settled, owing to their description under different names by different authors, and to the difficulty of homologizing the individual muscles under their many modifications in different birds. The insertion of the *syringomya* into the ends and not into the middle of the bronchial half-rings is characteristic of the true *Oscines*. See *Acronyptidi*, *Mesonyptidi*.

[Rare.]

It is a worse preservative of a general constitution than the *systasis* of Crete, or the confederation of Poland, or any other ill devised corrective which has yet been imagined in the necessities produced by an ill-constructed system of government. Burke, *Rev. in France*.

Any combination or assemblage of things adjusted as a regular and connected whole; a number of things or parts so connected as to make one complex whole; things connected according to a scheme; as, a *system* of canals for irrigation; a *system* of pulleys; a *system* of railroads; a *mountain system*; hence, more specifically, a number of heavenly bodies connected together and acting on each other according to certain laws; as, the *solar system*; the *system* of Jupiter and his satellites.

Who sees with equal eye, as God of all,
A hero perish or a sparrow fall,
Atoms or systems into ruin hurled,
And now a bubble burst, and now a world.

Pope, *Essay on Man*, l. 89.

Every work, both of nature and art, is a *system*; and, as every particular thing, both natural and artificial, is for some use or purpose out of and beyond itself, one may add to what has already been brought into the idea of a *system* its conduciveness to this one or more ends. Let us instance in a watch. Butler, *Analogy*.

A Natural *System* is one which attempts to make all the divisions natural, the widest as well as the narrowest, and therefore applies no characters peremptorily. . . . An Artificial *System* is one in which the smaller groups (the Genera) are natural, and in which the wider divisions (Classes, Orders) are constructed by the peremptory application of selected Characters (selected, however, so as not to break up the smaller groups). Whewell, *Philos. of Inductive Sciences*, I. p. xxvii.

For a *system*, in the most proper and philosophic sense of the word, is a complete and absolute whole. H. Bushnell, *Nature and the Supernatural*, II.

Star and *system* rolling past.

Tennyson, *In Memoriam*, Conclusion.

2. A plan or scheme according to which ideas or things are connected into a whole; a regular union of principles or facts forming one entire whole; an assemblage of facts, or of principles and conclusions, scientifically arranged, or disposed according to certain mutual relations so as to form a complete whole; a connected view of all the truths or principles of some department of knowledge or action; as, a *system* of philosophy; a *system* of government; a *system* of education; a *system* of divinity; a *system* of botany or of chemistry; a *system* of railroading; often equivalent to *method*.

There ought to be a *system* of manners in every nation which a well-formed mind would be disposed to relish. Burke, *Rev. in France*.

In the modern *system* of war, nations the most wealthy are obliged to have recourse to large loans. A. Hamilton, *The Federalist*, No. 30.

There was no part of the whole *system* of Government with which they [the Houses of Parliament] had not power to interfere by advice equivalent to command. Macaulay, *Sir William Temple*.

I am deeply convinced that among us all *systems*, whether religious or political, which rest on a principle of absolutism, must of necessity be, not indeed tyrannical, but feeble and ineffective *systems*. Gladstone, *Might of Right*, p. 102.

3. The scheme of all created things considered as one whole; the universe.—4. Regular method or order; plan; as, to have no *system* in one's business or study.—5. In *astron.*, any hypothesis or theory of the disposition and arrangements of the heavenly bodies by which their phenomena, their motions, changes, etc., are explained; as, the Ptolemaic *system*; the Copernican *system*; a *system* of the universe, or of the world.—6. In the *fine arts*, a collection of the rules and principles upon which an artist works.—7. (a) In *Byzantine music*, an interval conceived of as compounded of two lesser in-

tervals, as an octave or a tetrachord. (b) In *medieval and modern music*, a series of tones arranged and classified for artistic use, like a mode or scale. (c) In *modern musical notation*, two or more staves braided together for concerted music.—8. In *anc. pros.*, a group of two or more periods; by extension, a single period of more than two or three cola; a hypermetron. A *system* the metrical form of which is repeated once or oftener in the course of a poem is called a *strophe*.

9. In *bot.*: (a) An assemblage of parts or organs of the same or similar tissues. The principal systems of the body in this sense are the *nerve*, both cerebrospinal and sympathetic; the *muscular*, both voluntary and involuntary; the *osseous*, including the cartilages as well as the bones of the skeleton; the *vascular*, including the blood-vascular and lymphatic or absorbent; the *tegumentary*; the *mucous*, including the mucous membranes; and the *serous*, including the serous membranes. These systems may be subdivided, as the vascular into the blood-vascular and lymphatic systems; or some of them may be grouped together, as when the *connective-tissue* system includes the bones, cartilages, ligaments, tendons, and general areolar or cellular tissues of the body. Hence—(b) In a wider sense, a concurrence of parts or organs in some function. Most if not all such systems act physiologically by the concurrence of several other lesser systems; as, the *digestive* system; the *respiratory* system; the *reproductive* system. Hence—(c) In the widest sense, the entire body as a physiological unity or anatomical whole; as, to take food into the *system*; to have one's *system* out of order. (d) In *ascidiology*, the cœnobium of those compound tunicates which have a common cloaca, as the *Botryllidae*. Von Drasche, 1883.—10. One of the larger divisions of the geological series; as, the Devonian *system*; the Silurian *system*. The term is used by various geologists with quite different meanings, mostly, however, as the equivalent of *series*; thus, Cretaceous *system* (the Cretaceous series).

11. In *nat. hist.*: (a) In the abstract, classification; any method of arranging, disposing, or setting forth animals and plants, or any series of these, in orderly sequence, as by classes, orders, families, genera, etc., with due coordination and relative subordination of the several groups; also, the principles of such classification; taxonomy; as, the morphological *system*; a physiological *system*. There is but one adequate and natural *system*, namely, that which classifies animals and plants by structure alone, according to their degrees of genetic relationship, upon consideration of descent with modification in the course of evolutionary processes; it is the aim of every systematist to discover this true taxonomy and set it forth by classificatory methods. (b) In the concrete, any zoological or botanical classification; any actual arrangement which is devised for the purpose of classifying and naming objects of natural history; a formal scheme, schedule, or inventory of such objects, or a systematic treatise upon them; as, the Linnean or artificial *system* of plants; Cuvier's *system* of classification; the quaternary *system*. Such systems are very numerous, and no two agree in every detail either of classification or of nomenclature; but all have in view the same end, which is sought to be attained by similar methods, and upon certain principles to which most naturalists now assent.—Abkari *system*. It was based on the assumption that the body possesses a peculiar property of excitability, and that every agent capable of acting on the body during life does so as a stimulant. When these stimuli were normal in amount, the condition was one of health; if excessive, causing debility; if insufficient, causing indirect debility.—Canonical *system*, a system of differential equations of the forms

See *Linnean*.—**Logierian system**, in music, a system of instruction upon the pianoforte invented by J. B. Logier, and patented in England in 1814. It involved two things—the use of the chiroplast, a mechanical contrivance for holding the pupil's hands in a correct position at the keyboard, and the simultaneous instruction of several pupils at as many pianofortes. The chiroplast had drawbacks which have led to its being discarded, but the plan of class instruction is in use to some extent in all music-schools.—**Lot, Macleayan, male, mark, mercantile, metamorphic, metayer, military, moiety, muscular, natural, nervous, octave system**. It is thus finally made positive that the *Taconic system* is not a pre-Silurian system, and that the claiming for it equivalency with the Huronian was but a leap in the dark. It is manifest, in fact, that "*Taconic system*" is only a synonym of the older term "*Lower Silurian*," as this term was used by geologists generally twenty, thirty, and forty years since, and by many writers till a much later date. *J. D. Dana, Amer. Jour. Sci.*, Dec., 1888, p. 411.

Tail-rope, tarsal, territorial, tetragonal, etc., system. See the qualifying words.—**Three-field system**. See *field*.—**Vascular system**, the circulatory system.—**Water-vascular system**. See *water-vascular*.—**Syn. 1-4. System, Method**. Strictly, "*System*" is logical or scientific collocation. *Method* is logical or scientific procedure" (*C. J. Smith, Synonyms Discriminated*). But *system* is often used for *method*; *method* is not used for *system*. *System, Range, Chain*, in *orography*, as used by physical geographers writing in English, are nearly the same; thus, we find the "*Appalachian chain*" frequently called "*Appalachian range*" or "*ranges*," and also "*Appalachian system*." *System* is the more comprehensive term. All the *ranges* which go to make up a complex of mountains sufficiently nearly a unit, as popularly designated, to be embraced under one name, may be called a *system*; thus, the *ranges* of the Great Basin, some twenty or more in number, may properly all be classed together as forming the Great Basin "*mountain system*," or simply "*system*."

As thus defined, the Appalachian Region, *System*, or complex of *ranges*, extends from the promontory of Gaspe, in a mean direction of northeast and southwest, to Alabama—a distance of about 1,300 miles—where it disappears entirely, becoming covered by the much more recent geological formations, which form a broad belt along the Gulf of Mexico, and extend far up the Mississippi Valley. *J. D. Whitney, The United States*, p. 32.

The moon's greatest tidal action being *syzygial*, and the least at quadrature, should cause maximum impulse about the former, and minimum near the latter, period. *Fitz Roy*, *Weather Book*, p. 253.

2. Having the character of the articulation called a syzygy.

The anchylosed ring of first radials is succeeded by a tier of free second radials, which are united by a straight *syzygial* suture to the next series—the radial axillaries. *Sir C. Wyville Thomson*, *Depths of the Sea*, p. 449.

syzygium (si-zij'i-um), *n.*; pl. *syzygia* (-jī). [NL., < Gr. *σιζυγιος*, *σιζυγος*, yoked, paired: see *syzygy*.] In *zool.*, a syzygy.

syzygy (siz-i-jī), *n.*; pl. *syzygies* (-jīz). [= F. *syzygie* = Pg. *syzygio*, < L. *syzygia* (NL., in *zool.*,

syzygium), < Gr. *σιζυγία*, a conjunction, coupling, pair, in *pros.*, a syzygy, < *σιζυγος*, yoked together, paired, < *σιζυγνναι*, yoke or join together, conjoin, couple, < *σιν*, together, + *ζυγνναι* ($\sqrt{\zeta\eta}$), yoke, join: see *join*, *yoke*.] 1. In *astron.*, the conjunction or opposition of a planet with the sun, or of any two of the heavenly bodies. On the phenomena and circumstances of the syzygies depends a great part of the lunar theory.—2. In *anc. pros.*, a group or combination of two feet. Ancient metricians varied in their use of this term. Some use it regularly for a dipody or (dipodic) measure. Others call a tautopody, or double foot, a dipody, but a combination of two different feet a syzygy. Some, accordingly, giving the name *syzygy* to tetrasyllabic feet (regarded by them as composed of two dissyllabic feet), speak of an iambic or a trochaic line as measured by dipodies, but an Ionic line as measured by syzygies—that is, by single Ionics considered as combinations of trochees and pyrrhics. A peculiar use is the restriction of the term *syzygy* to compound feet of five or six syllables.

3. In *alg.*, a linear function in the variables. See *syzygetic*.—4. In *zool.*, the conjunction of two organs or organisms by close adhesion and partial conerescence, without loss of their identity; also, the thing so formed, or the resulting conformation; a syzygium: a term variously applied. (a) Zygosis or conjugation, as observed in various protozoans and other low organisms. See *conjugation*, *A. Diplozoon*, and *diapara*.

(b) Suture, or fixed articulation, of any two joints of a eroid ray, or the joints thus sutured, with partial obliteration of the line of union. The first of the brachial joints [in the *Pentactinus as-terial*]—that is to say, the joint immediately above the radial axillary—is, as it were, split in two by a peculiar kind of joint, called by Muller a "*syzygy*." All the ordinary joints of the arms are provided with muscles producing various motions, and binding the joints firmly together. The *syzygies* are not so provided, and the arms are consequently easily snapped across where these occur. *Sir C. Wyville Thomson*, *Depths of the Sea*, p. 440.

Epithematic syzygy, in *anc. pros.*, the last four parts of the parabasis—that is, the strophe or ode, epirrhema, antistrophe or antode, and antepirrhema; the choric as distinguished from the monodic parts of the parabasis.

szaboite (sab'ō-it), *n.* [Named after Prof. J. Szabo, of Budapest in Hungary.] A variety of hypersthene, first described erroneously as a new triclinic member of the pyroxene group.

syaibelyite (sā-bel'yit), *n.* [Named from *Szaj-belyi*, a Hungarian.] A hydrous borate of magnesium, occurring in white nodules of acicular crystals in a gray limestone at Werksthal in Hungary.

Syzygy of *Diplozoon paradoxum*.

1. The twentieth letter and sixteenth consonant of the English alphabet. of the Phœnician alphabet the corresponding sign was the twenty-second and last; what follows *t* in Greek and Latin, and also in our own scheme, is the result of successive additions made to the system borrowed from Phœnician. (See the several letters below.) The comparison of forms (compare *d*) is as follows:

The value of the sign has been practically the same through the whole history of its use; it denotes the sibilant (or breathed) mute (or check) produced by a complete closure (with following breath or explosion) between the tip of the tongue and a point on the roof of the mouth either close behind or not far from the bases of the upper front teeth. Its corresponding sonant or voiced mute is *d*, and its nasal is *n* (see these letters). They are often called *dental* or *teeth-sounds*, though the teeth have really no part in their production; hence also, and better, *lingual*, or *front lingual*, or *tongue-tip*, etc. They are much more common elements of our utterance than either of the other two classes, palatal (*k, g, ŋ*) or labial (*p, b, m*); they constitute, namely, about 18 per cent. of the sounds we make (*t* nearly 6 per cent., *d* nearly 5, *n* nearly 7), against palatal 4 per cent., and labial 6%. A sound which our ears would at once recognize and name as a *t*-sound is producible in other positions of the organs than that described above—namely, at points further back on the roof of the mouth, and with parts of the tongue behind the tip, and even of its under surface. Hence the occurrence in some languages of more than one *t*, distinctly recognized as separate members of the spoken alphabet (so two in Sanskrit, etc., and even four in Siamese); our own *t* also which forms the first part of the compound *ch* (= *tsh*) is slightly but constantly different from our *t* elsewhere. As in many other languages (and partly by direct inheritance from French, and even from later Latin, alterations), the *t* in English shows a tendency to become palatalized and converted into a sibilant when followed by palatal sounds, as *i, e, y*. Hence, in many situations, it combines with such sounds, either regularly or in rapid utterance, producing the *ch*-sound, as in *question, mixture* (compare the corresponding conversion of *s* to *sh*, under *S*); and even, in a great number of words having the endings *-tion, -tious, -tid*, etc., it becomes a sibilant and makes the *sh*-sound, as in *nation, factions, partial*, etc. *T* also, like others of our consonants, frequently occurs double, especially when medial: thus from *fit* *fitted, fitter, fitting*. With *h*, *t* forms the digraph *th*, which has the position and importance of a fully independent element in the alphabet, with a double pronunciation, sibilant and sonant (or breathed and voiced): sibilant in *thin, breath*; sonant in *this, breathe*—both as strictly unitary sounds as *t* and *d*, or *s* and *z*. They are related with *t* and *s*, etc., as tongue-tip sounds, especially with *s* and *z* as being fricative and continuant; but they are of closer position than the latter, the closest that can be made without actual stoppage of the breath, and are usually formed with the tongue thrust further forward, against or even beyond the teeth: hence their substitution for *s* and *z* by persons who lisp. In regard to their grade of closure, they are akin to *f* and *v*, and belong in one class with these (oftenest and best called *spirants*). As an *f* comes in part from an aspirated *p*, or *ph*, so also the *th*-sounds from an aspirated *t*; and in this way they have obtained their usual representation: the Greek *θ*, which was an aspirated *t* (that is, a *t* with separately audible *h* after it), was written in Latin with *th*, and then, when the aspirate came to be pronounced as a spirant, this was continued in use as representative of the latter. And in this case the Latin digraph has crowded out of English use the sign (or rather the two signs) which in Anglo-Saxon represented the *th*-sounds—namely, *þ, ð*—much to the detriment of our present alphabet. Of the two *th*-sounds, the sonant (or *this* and *breathe* sound) is much the more frequent, owing chiefly to the constant recurrence of the pronominal words, particularly *the*, in which it is found; it is nearly 4 per cent. of our utterance, while the sibilant (or *thin* and *breath* sound) is less than two thirds of one per cent. In the phonetic history of the Germanic part of our language, *t* regularly and usually (when special causes do not prevent) comes from an older *d*; and, on the other hand, *th* from an older *t*; examples for *t* are *two* corresponding with *duo, cat* with *ad or ed*; for *th*, *thou = tu, three = tri, beareth = fert*; for both together, *that = tad, tooth = dent*.

2. As a medieval numeral, 160; with a line over it (*T*), 160,000.—3. Tabanidæ (*ta-ban'i-dē*), *n. pl.* [NL. (Leach, 1819), < *Tabanus* + *-idæ*.] A large family of biting flies, of which *Tabanus* is the typical genus; the gadflies, breezes, or elegs, having the third joint of the antennæ annulate and without a distinct bristle. The proboscis of the female is adapted for piercing, and inflicts a painful although not irritating wound. The male does not bite. They fly with extraordinary speed, and the swiftest horse cannot elude them. The spindle-shaped brown or black eggs are attached in groups to the stems and leaves of low-growing plants, and the larvae are either aquatic or live in damp earth. They are predaceous, and feed upon snails or small insects. The young larvae of many species penetrate beetles and other larvae, and remain within until they have entirely consumed them. Over 1,300 species are known; 150 are North American. Many of them are among the largest and most powerful of the *Diptera*, but most are of moderate size. They fly in bright sunny weather. Also *Tabanides*. See cuts under *breeze, Chrysops*, and *gadfly*.

Tabebuia (tab-ē-bū'ī), *n.* [NL. (Gomez, 1803; from Braz. name.)] A genus of gamo-

petalous plants, of the order *Bignoniaceae*, tribe *Tecomaeae*, and section *Digitifoliae*. It is characterized by loosely racemose or cymose flowers with a tubular and at length variously ruptured calyx, an elongated and greatly enlarged corolla-tube, four perfect stamens, and a sessile ovary ripening into a somewhat cylindrical ecostate capsule with numerous flat seeds, each with a large hyaline wing. There are about 60 species, natives of tropical America from Brazil to the West Indies and Mexico. They are erect shrubs or trees, smooth or hairy, often drying black. They bear usually large flowers and alternate or scattered leaves, which are generally composed of five to seven digitate leaflets, sometimes reduced to three or to one. Several species are used medicinally, as *T. impetiginosa*, which yields a bitter mucilaginous bark and abounds in tannin. Many are valuable trees, yielding an almost indestructible timber; several are known in tropical America as *roble* — that is, *oak* — and are used for house- and ship-building, or for making bows, as *T. toxophora*, the *pa-u-d'areo* of Brazil. The names *whitewood* and *box-wood* are given to *T. Leucogylon* in the West Indies, and the former name also to *T. pentaphylla*; both are timber-trees with whitish bark and white or pink flowers. *T. serratifolia*, a small tree with yellow flowers, is known as *gony* in Trinidad. All the above species were formerly classed under *Tecoma*, but are removed to *Tabebuia* on account of their digitate, not pinnate, leaflets. A very different species, *T. uliginosa*, a shrub with simple entire leaves, is known as *Brazilian cork-tree*, from the use of its soft wood.

3. In *Jewish hist.*, a tent constructed to serve as the portable sanctuary of the nation before its final settlement in Palestine. This "tabernacle of the congregation" is fully described in Ex. xxv. -xxvii. and xxxvi. -xxxviii. It comprised, besides the tent, an enclosure or yard, in which were the altar of burnt-offerings and the laver. The tabernacle proper was a tent divided into two chambers by a veil — the inner chamber, or holy of holies, containing the ark of the covenant and the mercy-seat, and the outer chamber the altar of incense, the table of showbread, and the golden candlestick. The tabernacle was of a rectangular figure 45 feet by 15, and 15 feet in height. The court or yard was 150 feet in length by 75 feet, and surrounded by screens 7½ feet high. The people pitched round the tabernacle by tribes in a fixed order during their wanderings, and the pillar of cloud and of fire, denoting Jehovah's presence, rested upon it or was lifted from it according as they were to remain stationary or were to go forward. After the arrival in the promised land it was set up in various places, especially at Shiloh, but gradually lost its exclusive character as the center of national worship before the building of Solomon's temple, in which its contents were eventually placed.

And he spread abroad the tent over the *tabernacle*, and put the covering of the tent above upon it. Ex. xl. 19.

And they brought up the ark [to the temple built by Solomon], and the *tabernacle* of the congregation [tent of meeting, R. V.], and all the holy vessels that were in the *tabernacle*, these did the priests and the Levites bring up. 2 Chron. v. 5.

Hence — **4.** A place or house of worship; especially, in modern use, an edifice for public worship designed for a large audience: often now the distinctive name assumed for such an edifice.

The shed in Moorfields which Whitefield used as a temporary chapel was called "The *Tabernacle*"; and, in the scornful dialect of certain Church-of-England men, Methodist and such-like places of worship have, since then, been known as *tabernacles*.

F. Hall, False Philol., p. 24, note.

5. A receptacle for the reserved eucharist; especially, a constructional receptacle for this purpose, containing the pyx. The tabernacle, as now commonly seen in Roman Catholic churches, is a recess with a door, placed over and behind the high altar or one of the side altars, usually having over it a cross or crucifix with a design in relief, the whole surmounted by a canopy. In earlier times a movable ark, or usually a suspended dove (columba) or a tower, held the eucharist or the vessel containing it. In England the general medieval custom was to place the sacrament in an ambry on one side of the sanctuary or in the sacristy. The tabernacle is a later development of the ark or ambry as a permanent construction over the high altar and surmounted by a canopy or ciborium, often in the spire-like shape developed from the older tower; hence the name *tabernacle* is often given especially to this canopy or to canopies of similar appearance.

Among the ancient Jews it

lasted eight days, during which all the people gathered at Jerusalem and dwelt in booths. (See Lev. xxiii. 34-36; Num. xxix. 12-39.) Among the modern Jews the feast has been prolonged one day.

Tabernæmontana (tā-bér'nā-mon-tā'nā), *n.* [NL., named after Jacobus Theodorus *Tabernæmontanus*, a German physician and botanist (died 1590).] A genus of gamopetalous plants, of the order *Ipogonaceæ* and tribe *Plumierieæ*, type of the subtribe *Tabernæmontaceæ*. It is characterized by cymose flowers, a calyx furnished at the base of its five lobes with a continuous or interrupted ring of glands, and a fruit of two many-seeded berries or fleshy follicles which are large and globose or smaller and oblique or recurved. There are about 150 species, widely scattered through tropical regions. They are trees or shrubs, commonly smooth, bearing opposite thin or coriaceous feather-veined leaves. The small cymes of white or yellowish silver-shaped flowers are terminal or variously placed, but not truly axillary. The smooth or three-ribbed pulpy fruit contains several or many ovoid or oblong seeds with fleshy albumen; in several species it is ornamental—in *T. macrocarpa* and others of the section *Rejona*, mainly of the Malay archipelago, resembling a reddish orange in appearance. Instead of the acrid, drastic, and poisonous milky juice of most related genera, many species of *Tabernæmontana* secrete a bland and wholesome fluid, sometimes useful as a nourishing drink, as in *T. utilis*, the cow-tree or hya-hya of British Guiana, which yields a thick, sweet, white liquid, made somewhat sticky by the presence of caoutchouc. This species also yields a soft white wood and a medicinal bark. *T. orientalis*, the Queensland cow-tree, and *T. coronaria*, known as *Adam's apple* or *East Indian rose-bay*, are sometimes cultivated, forming small evergreen trees, the latter under glass and also naturalized in tropical Asia from the Cape of Good Hope. Several other species are cultivated under glass for their large fragrant flowers and ornamental deep-green leathery leaves. *T. crassa*, the kokpok-tree of Sierra Leone, produces a fiber there made into a cloth known as *dolo-cloth*. A species in Ceylon, known as *dirictadner*, probably *T. dichotoma*, has been called *forbidden fruit*, from its beautiful but poisonous fruit bearing marks fancied to be the prints of the teeth of Eve.

4†. In music: (a) The system of rules for the poetry of the mastersingers. (b) Musical notation in general. (c) A form of musical notation for various instruments, like the lute, the viol, the flute, the oboe, or the organ, used in Europe from the fifteenth to the beginning of the eighteenth century. It differed from the more general staff notation in that it aimed to express not so much the pitch of the tones intended as the mechanical process by which the particular instrument those tones were to be produced. *Tablature*, therefore, varied according to the instrument in view. In the case of the lute, for example, a horizontal line was usually drawn for each string, forming a kind of staff; and letters or numerals were placed on these lines, indicating not only which strings were to be touched, but at what frets they were to be stopped. Various arbitrary signs were also used instead of letters or numerals, or in combination with them. Music thus noted was said to be written *lyra-cord*, in distinction from *spinnet-cord* (in the staff notation). In the case of wind-instrument, like the

flageolet, points or dots were often placed on horizontal lines to indicate which finger-holes were to be closed to produce the required tones. In the case of the organ, notes were often written out by their letter names. In all these systems and then numerous variants, marks were added above or below to indicate the desired duration of the tones, the place and duration of rests, and various details of style. *Tablature* had obvious advantages as a notation for particular instruments. Various technical marks now used are either derived from it or devised on the same principle. The tonic sol-fa notation, that of thorough-bass, and the little used systems of numeral or character notes are essentially analogous to it. Also *tablature*.

and pivoted centrally to an oscillating arm which has at
the other end a fixed bearing. It receives motion from
a crank and pitman, the latter being pivoted to the mov-
ing table at a considerable distance from the first-named
pivot. This arrangement produces a motion of the table
analogous to that of hand-rubbing. The moving table is
weighted on the upper side, and faced on the under side
with slate, and it works over a large flat bed. In use, a
plate of glass is cemented to the slate face of the mov-
ing table and another to the bed. The upper plate is
then rubbed upon the lower, the grinding commencing
with the use of coarse emery. This is succeeded by the
use of finer grades. The final polishing is done by an-
other process.—Multiplication *table*. See *multiplica-*

Taboo rests primarily upon religious sanctions, but is also a civil institution; and a taboo may be applied in various ways by a priest or a chief, or even sometimes by a private person, though with limited effect. Some taboos are permanently established, especially those affecting women; a special taboo may affect any of the relations or doings of life, or any subject animate or inanimate, either permanently or for a fixed period. As an institution, taboo has ceased or is dying out in most of the regions mentioned, through European influence; but both the principle and the practice have existed or still exist to some extent, under different names, among primitive peoples generally.

The most important *tacamahac* is derived from *Calophyllum Inophyllum*, of the East Indies, Polynesia, etc. (see *tamanu*), of which the *C. Tacamahaca* of Madagascar and the isle of Bourbon is a variety. The resin is of a greenish-yellow color, liquid at first, but hardening into a brittle aromatic mass soluble in alcohol and ether.

It exudes spontaneously or through incisions from the bark and roots. A similar gum is afforded by *C. Calaba* in the West Indies. The South American *tacamahac* is the product of *Bursera* (*Elaphrium*) *tonnentosa* and *E. excelsa*, of *Protium* (*Iceia*) *heptaphyllum*, and perhaps of some other trees. The buds of *Populus balsamifera* (see def. 2) are varnished with a resin which may be included under this name, occasionally used in the place of turpentine and other balsams.

They are perennial herbs from a tuberous or creeping rootstock, with large radical leaves which are entire, lobed, or dissected, and a dense umbel of brown, lurid, or greenish flowers terminating in an erect leafless scape, and involucre with an exterior row of herbaceous or colored bracts. The numerous inner bracts are long, filiform, and pendulous, and have been erroneously regarded as sterile pedicels.

T. pinnatifida, the plant, yields a nutritious starch, the South Sea arrowroot (See *pisca*). Its leafstalks are boiled and eaten in China and Cochinchina; in Tahiti they are dried and plaited into bonnets. Other species, thought to be valuable as starch-plants, occur in Australia, India, Madagascar, Guinea, and Guiana. Several species were formerly separated as a genus *Alcatia* (K. B. Presl, 1830), having entire leaves and a spreading perianth.

Specifically—(a) A contrivance for indicating small variations in the velocity of machines, one form of which consists of a cup and a tube opening into its center, both being partly filled with mercury or a colored fluid, and attached to a spindle. This apparatus is whirled round by the machine, and the centrifugal force produced by this whirling causes the mercury to recede from the center and rise upon the sides of the cup. The mercury in the tube descends at the same time, and the degree of this descent is measured by a scale attached to the tube. The velocity of the machine being lessened, the mercury rises in the center, causing a proportionate rise in the tube. (b) An instrument for measuring the velocity of running water in rivers, etc., as by means of its action on a flat surface connected with a lever above the surface carrying a movable counterpoise, or by its action on the vanes of a wheel, whose revolutions are registered by a train of wheelwork; a current-measurer. It is characterized by usually radiate flower-heads with a papus of five or six awns, and surrounded by a single row of equal involucre bracts which are connate into a more or less lobed cup or cylinder, and are dotted with oily glands. There are about 50 species, natives of America from Buenos Ayres to Mexico. They are smooth erect branching or diffuse herbs, bearing opposite and commonly pinnately dissected leaves, and yellow or orange flower-heads, which are long stalked, large, and showy, or densely corymbed and smaller. The posterior extremity of an animal, in any way distinguished from the rest of the body; the hind end or hinder part of the body, opposite the head; especially, the coccygeal region or caudal appendage, when prolonged beyond the rest of the body. More particularly (a) In mammals generally, the cauda, which may be a mere stump, or a slender appendage longer than the rest of the body. It consists of an indefinitely numerous series of coccygeal vertebrae with usually elongated bodies and reduced or aborted processes or neural canal, covered with flesh, etc., and enveloped in integument frequently hairy, like the rest of the body. These vertebrae resemble the joints or phalanges of a finger, and the whole organ is usually flexible, and may be prehensile, like a hand. In mammals without hind limbs, as cetaceans, the tail is the small or tapering hind part of the body ending in the flukes, or the flukes themselves. (b) In birds, the tail feathers collectively. (c) In reptiles, the prolongation of the body behind the anus, of whatever character. In reptiles with legs, as crocodiles, turtles, most lizards, and nearly all batrachians, the tail obviously corresponds to the part so named in mammals; it is often extremely long, slender, flexible and lash-like, and generally fragile. It may be sometimes replaced by a new growth when broken off. In serpents and other limbless reptiles the tail is marked by the position of the anus as indicating the end of the body-cavity; it is solid and muscular, and often differently scaled from the parts in advance of it. (d) In fishes (as in cetaceans, above), the tail is the postabdominal part of the body, behind the anus, usually tapering and ending in the caudal fin; also, this fin itself in some cases. In such fish-like vertebrates as the rays, the tail is often a long, slender, whip-like appendage, well distinguished from the rest of the body. See cuts under *fish* and *diphy-cereal*. (e) In crustaceans, the abdomen or abdominal region, with its appendages; the part of the body which succeeds the cephalothorax; the urosome. It is usually conspicuous, and may be longer than the rest of the animal. It is well marked in the macrurous or long-tailed crustaceans, as lobsters, prawns, shrimps, crawfish, etc., consisting of a series of flexible segments with appendages in the form of swimmerets, a rhipidura, a telson, etc. In the short-tailed or brachyurous crustaceans, as crabs, the tail is reduced and folded closely under the body, forming the apron. (f) In insects, the end of the abdomen, in any way distinguished; the pygidium; the claspers; the ovipositor, etc.; as, the bee carries a sting in its tail. (g) In many arachnids, as scorpions, a well-marked abdominal or postabdominal region of the body, behind the thorax; its character is similar to that of the tail of a crustacean. (h) In worms, etc., the tail-end, or any part of the body away from the head. It is sometimes well marked, as in *Cephalobranchia*. Compare *tag-tail*, 1. (i) The buttocks. [Low.]

Said also sometimes of a petiole or peduncle. (f) In *musical notation*, same as *stem*. These coverts are divided into superior and inferior, or upper and under coverts. They are commonly short, covering only the bases of the rectrices, but sometimes extend far beyond them; the gorgeous train of the peacock, for example, consists of rectrices, not rectrices, as is also the case with the beautiful train of the paradise trogon. The ornamental feathers called *morabou-feathers* are the under tail-coverts of a species of stork, and in certain other storks these coverts simulate rectrices. tail-feather (tāl'feθ'ēr), *n.* One of the feathers of a bird's tail; specifically, the rectrices, or rudder-feathers, usually stiff pennaceous feathers, always devoid of a hypomachis, as distinguished from the rectrices or tail-coverts. Tail-feathers, like flight-feathers, have for the most part a wide inner and narrow outer vane, and when the tail is closed or folded they overlap one another alternately from side to side. The two middle feathers, whose webs are more nearly equal, and which overlap all the rest, are sometimes distinguished as *deck-feathers*. Tail-feathers are always paired, and hence of an even number. The number prevailing among birds is 12; this is characteristic, having few exceptions among all *Passeres*, whether oscine or clunatorial, and among many other birds, as birds of prey. In piscarian birds 10 is the rule, though many have 12, and a few only 8; woodpeckers have 12, though apparently 10, one pair being rudimentary. In pigeons the rule is 12 or 14; sometimes there are 16 or 20. In gallinaceous birds the numbers run from 12 to 18 or 20. Waders have usually 12, often more, up to 20. Swimming-birds have sometimes only 12, usually higher numbers, as 16, 18, 20, 24, or even 32. The archæopteryx appears to have had 40. In a few birds the tail-feathers proper are extremely modified, as in the lyre-bird. (See *Menura*, *Trochilidae*.) Tail-feathers which project far beyond the rest are said to be *long-exserted*. Shapes of individual rectrices are described as *truncate*, *incised*, *linear*, *acute*, *acuminate*, *filamentous*, *spatulate*, *micronate*, etc. (See these words.) The relative lengths of rectrices go far to determine the shape of the tail as a whole, which is usually in the form of a fan. The termination of the tail is described as *even*,

truncate, acute, acuminate, cuneate, forked, forficulate, furcate, emarginate, rounded, double-rounded, double-forked, etc. When the tail-feathers of opposite sides come together vertically, as in the rare but familiar case of the barn yard fowl, the tail is said to be *complicate* or *folded*. The same tendency in the reversed direction results in the *scaphoid* or *boat-shaped* tail. A tail-feather spatulate at the end is called a *racket*. Some tail-feathers are coiled, *circinate* or *scorpioid*; others form a lyrate figure. A few birds, as grebes, have only rudimentary or no proper tail-feathers. The word is loosely extended to include tail-coverts in some cases. See cuts under *boat-shaped*, *Cin-cinurus*, *tyre-bird*, *Sappho*, *Spathura*, and *Topaza*.

In *surg.*, same as *tail*¹, 5 (c).—3. *pl.* The parts or a part of any incoherent or fluid material separated as refuse, or separately treated as inferior in quality or value; leavings; remainders; dregs. The tailings of grain are the lighter kernels blown away from the rest in winnowing; of flour, the inferior kind separated from the better in bolting. Tanning-liquor that has become "sour" or impure is called *tailings*. In metallurgy tailings are the part rejected in washing an ore that has passed through the screens of a stamp-mill, the worthless slimes left after the valuable portion has been separated by dressing or concentration. The part rejected as tailings may, however, at a future time be worked over and made to undergo still further concentration. The sand, gravel, and cobbles which pass through the sluices in hydraulic mining were formerly generally designated as *tailings*; of late years, and especially in State and United States legislative documents, they have been called "mining debris" or simply "debris."

The refuse material thrown aside in quartz, drift, hydraulic, or other mines, after the extraction of the precious metal, is called *tailings*. The tailings from hydraulic mines are called "debris" also.

tailor-bird (tāl'lor-bērd), *n.* One of various small passerine birds of the Oriental or Indian region, noted for the ingenuity with which they sew leaves together to form a nest. These birds

are a sort of grass-warblers, grouped under the name *Cisticolidae*. They belong to such genera as *Sitta*, *Suthora*, *Prinia* (with only ten tail-feathers, contrary to the rule in *Passeres*), and especially to *Sutoria* and *Orthotomus*. There are many species, some now placed in other genera. The original *tailor-bird* of Latham (1783) was based upon a bird first described by Fors-

Nest of Tailor-bird.

ter in 1781 as *Motacilla sutoria*, and given a French name by Latham in 1782, with reference to the two long middle tail-feathers. These descriptions furnished two potential species, long known as *Sutoria sutoria* and *S. longicauda* respectively. But Bonaparte in 1820 founded a genus *Orthotomus* upon *O. sutoria*, after which the original tailor-warbler was usually placed in *Orthotomus*, and received in the course of time several other specific designations. In 1831 Nicholson founded the genus *Sutoria* upon the original type species of Latham, Sutoria, and Latham; and in 1834 Lesson founded a nominal genus *Echlo* upon a species of *Orthotomus*. The result of this by no means remarkable confusion in generic names is that the species of *Sutoria* proper have usually been called *Orthotomus*. (a) There are 3 species of *Sutoria*, or tailor-birds proper: *S. sutoria* or *S. longicauda* (mostly called *Orthotomus sutoria* or *O. longicauda*), throughout India and Ceylon, in parts of China, in Formosa, Hainan, etc.; *S. obsoleta* of Java; and *S. maculipennis* of the Malay peninsula. (b) There are 10 or 12 species of *Orthotomus* proper, ranging from the Burmese countries and the Malay peninsula to Java, Sumatra, Borneo, and the Philippine S. See also cuts under *Sutoria* and *Orthotomus*.

τῶν, endure, + *παύω*, go through, try: see *pirate*.] A genus of tineid moths, typical of the family *Talaperiidae*, having twelve-veined forewings, and in the male both palpi and ocelli. It includes certain European sac-bearing species formerly included in the family *Psychidae*. *T. pseudobombicella* is one of the best-known species.

Talaperiidae (tal'ē-pō-rī-i-dē), *n. pl.* [*NL.*, *< Talaporia + -idae*.] A family of tineid moths, formerly placed among the *Bombicæ*, and including the genera *Talaporia* and *Solenobia*. It differs markedly from the *Psychidae*, in which it was formerly put, by the non-pectinate roale antennæ, by the presence of legs and antennæ in the female, and by the fact that the pupa works its way almost entirely out of the larval case. The larva live in triangular silk-lined bags, to which bits of wood or sand are attached, and the female moths resemble those of the *Psychidae* in being entirely wingless.

talapoin (tal'a-poin), *n.* [Formerly also *talapoin*, *talappoi*, *talapoie*, *talipoi*, *talupin*; *Pg. talapão*, formerly *talapoy*, *It. talapoi*, etc.; of obscure E. Ind. origin.] 1. A Buddhist monk of Ceylon, Siam, etc.

talaria (tāl-lā-rī-ä), *n. pl.* [*L.*, neut. pl. of *talaris*, of or pertaining to the ankle, *< talus*, the ankle, the ankle-bone: see *talus*.]

In classical myth, and *archæol.*, the sandals, bearing small wings, worn characteristically by Hermes or Mercury and often by Iris and Heos (Dawn), and by other divinities, as Eros and the Furies and Harpies. In late or summary representations of the deity the sandals are sometimes omitted, so that the wings appear as if growing from the ankles, one on each side of the foot. Sometimes, especially in archaic examples, the talaria have the form of a sort of greaves bearing the wings much higher on the leg. They symbolize the faculty of swift and unimpeded passage through space.

talaric (tāl-lar'ik), *a.* [*< L. talaris*, of or pertaining to the ankle: see *talaria*.] Pertaining to the ankles; especially in the phrase *talaric chiton* or *tunic*, of Greek antiquity—that is, one reaching to the ankles or feet, as the long tunic of the Ionian Greeks.

talbot (tāl'bot), *n.* [Probably from the *Talbot* family, who bear the figure of a dog in their coat of arms.] 1^t. A kind of hound, probably the oldest of the slow-hounds. This dog had a broad mouth, very deep chops, and very long and large pendulous ears, was fine-coated and usually pure-white. This was the hound formerly known as St. Hubert's breed, and is probably the original stock of the bloodhound.

Jesse says the earliest mention of bloodhounds was in the reign of Henry III. The breed originated from the *talbot*, which was brought over by William the Conqueror, and seems to have been very similar to the St. Hubert.

The Century, XXXVIII, 189.

2. In *her.*, a dog, generally considered as a mastiff, represented with hanging ears, and tail somewhat long and curled over the back: it is represented walking unless otherwise blazoned.

Talbot published, six months before the discovery of the Daguerreotype, his process with the chloride of silver; and the year following the Calotype, or, as it is now frequently denominated, the Talbotype, was made known.

Its prevailing colors are white, apple-green, and yellow. There are three principal varieties of talc—foliated, massive (including soapstone or steatite), and indurated. Indurated talc is used for tracing lines on wood, cloth, etc., instead of chalk. Talc is not infrequently formed by the alteration of other minerals, particularly the magnesian silicates of the pyroxene group; thus, *rensselaerite* is talc pseudomorphous after pyroxene, and a fibrous form of talc (sometimes called *agallite*), pseudomorph after enstatite, is found at Edwards, New York, and when finely ground is used in giving a gloss to paper. Talc is also used as a lubricator, and steatite or soapstone for hearthstones, etc.

All this porphyrony seems to have been the kingdom of Carpasia. I observed in this part a great quantity of talc in the hills. *Poore*, *Description of the East*, II, i, 21^s.

Many rocks have been classed as *talc-schist* which contain no talc, but a hydrous mica. These have been called by Dana hydro-mica-schists. *Talc-schist* is not specially abundant, though it occurs in considerable mass in the Alps (Mont Blanc, Monte Rosa, Carinthia, etc.), and is found also among the Apennine and Pyrenean Mountains.

the sense 'gift, endowment,' suggested by the
parable of the talents (*Mat.* xxv.).] 1. An an-
cient denomination of weight, originally Baby-
lonian (though the name is Greek), and vary-
ing widely in value among different peoples
and at different times. All the Assyrian weights had
two values, the heavy being double the light, and there
were also various types of each. The royal Babylonian
commercial talent (or Assyrian talent) was divided into
60 minas, and each mina into 60 shekels. Its value
(light weight) was in one type 23.63 kilograms (65 pounds
5 ounces avoirdupois), and in another 30.10 kilograms
(66 pounds 5½ ounces). Derivatives of this talent (which
was equivalent to 3,000 shekels) were in use in Syria and
Palestine and in Phœnician colonies. Its money value
is reckoned as approximately from \$1,700 to \$2,000. The
Babylonian gold talent contained only 50 minas, and was
thus five sixths of the commercial weight. The Baby-
lonian silver talent was formed by multiplying the com-
mercial talent by 133 (the ratio of silver to an equivalent
mass of gold), and afterward dividing by 10. The result-
ing light talent was sometimes again divided by 2.
Derivatives of this talent were in use in Persia, Lydia,
Macedonia, and Italy. It is the basis of much of the
most ancient silver coinage. The Phœnician silver talent,
probably derived from the Babylonian, was in its lighter
types about 43.4 kilograms (95 pounds 9 ounces avoirdupois),
and, being halved, was adopted into the Ptole-
maic system. The chief Greek talents were as follows:
Old Æginetan, 40.3 kilograms (88 pounds 12 ounces); em-
porætic Attic (substantially later Æginetan), 36.4 kilograms
(80 pounds 4 ounces); Solonic (= Egyptian), 25.8 kilograms
(56 pounds 14 ounces). Talents mentioned by Homer and
some other of the oldest writers appear to be small weights,
perhaps shekels. The later Attic talent contained 60 minas,
or 6,000 Attic drachmas, equal to 56 pounds 14 ounces. As
a denomination of silver money it was equal to about \$1,000.
The great talent of the Romans is computed to be equal
to £29 6s. 8d. sterling, or about \$480, and the little talent
to £75 sterling, or about \$363.

MHG. *tolk*, an interpreter (ME. *tolk*, *talk*, a man), < Lith. *tolkas*, an interpreter (see *tolk*); but this notion is inconsistent with the form of the verb (no ME. form **tolken* appears in either sense 'talk' or 'interpret'), with phonetic laws (ME. **tolken* would not change to *talken*, and would not produce a mod. form *talk*, pron. tāk), and with the sense ('talk' and 'interpret' being by no means identical or adjacent notions). The fact that the formative *-k* is not common in ME. is not an argument against its admission in this case, inasmuch as it does actually occur in *stulk*¹, *smirk*¹, and other cases. = *SYN.* 1 and 2. *High, Tall, Lofty*. *High* is the most general of these words, and has some uses different from those of the others. When we say that a cloud is *high*, we may mean that it extends very far upward, or, more probably, that it is unusually far above the earth. *Tall* describes that which is slim in proportion to its height, as a mast, a pine or other tree, a steeple, a person, possibly a cliff; *tall* houses may be found in some parts of the world; a *tall* cloud would be of small width and great comparative height. *Tall* is also associated with height to which we are used or which we have come to regard as standard. A giant is *tall*, because so much *taller* than most men. *Lofty* denotes an imposing height; a room cannot well be *tall*, but may be *high*, or even *lofty*; as, the *lofty* arches of Westminster Hall. *High* and *lofty* may have application to moral or intellectual character; *tall* has not, except colloquially. *Tall* seems somewhat figurative when applied to that which does not live and grow.

In commerce tallow is divided into various kinds according to its qualities, of which the best are used for the manufacture of candles, and the inferior for making soap, dressing leather, greasing machinery, and several other purposes. It is exported in large quantities from Russia.

tally¹ (tal'i), *n.; pl. tallies (-iz).* [Formerly also *tallie; < ME. taly, talye, a later form of talle, taile, tyle, etc., a cutting, a cut, etc.; see tall².*] 1. A piece of wood on which notches or scores are cut to mark numbers, as in keeping an account or giving a receipt; loosely, anything on which a score or an account is kept. Before the use of writing, or before writing became general, this or something like it was the usual method of keeping accounts. In purchasing and selling it was customary to make duplicate tallies of the transaction, or to split one tally through the middle. In the English Exchequer tallies were used till 1812, which answered the purpose of receipts as well as simple records of matters of account. An Exchequer tally was an account of a sum of money lent to the government, or of a sum for which the government would be responsible. The tally itself consisted of a squared rod of hazel or other wood, having on one side notches indicating the sum for which the tally was an acknowledgment. On two other sides, opposite to each other, the amount of the sum, the name of the payer, and the date of the transaction were written by an officer called the writer of the tallies. This being done, the rod was then cleft longitudinally in such a manner that each piece retained one of the written sides, and one half of every notch cut in the tally. One of these parts, the *counterfoil* or *counterstock*, was kept in the Exchequer, and only the other, the *stock*, issued. When the part issued was returned to the Exchequer (usually in payment of taxes) the two parts were compared, as a check against fraudulent imitation. This was called *tally* or *tallies*. The size of the notches made on the tallies varied with the amount. The notch for £100 was the breadth of a thumb; for £1 the breadth of a barleycorn. A penny was indicated by a slight slit.

Alas! I cannot pay a jot; therefore
He kisse the *tally*, and confesse the score.
Herick, To God.

Have you not seen a Baker's Maid
Between two equal Panniers sway'd?

On either side you hear 'em clatter.

Prior, Alma, ii.

3. A mark made to register a certain number of objects; one of a series of consecutive marks by which a number of objects are recorded or checked; also, a number as thus recorded; a number serving as a unit of computation. Thus, when packages of goods of uniform size and character are being delivered and an account of them taken, every fifth mark usually is called *tally*, and in counting aloud the word *tally* is used instead of five, after which the enumeration begins again; this is marked on a clerk's book, *tally* being the diagonal mark; though sometimes each mark is a *tally*, and the fifth or diagonal one is a *tally of tallies*.

4. A man who lives with a woman without marriage. See *to live tally*, under *tally¹, n.* [Prov. Eng.]

It is probable that the terms *tally-woman* and *tally-man* have arisen from the usage of pit tallies as a means of identity in the matter of coals; and so, figuratively, a man and woman living together without marriage bear each other's tally as a sign of temporary ownership.

The fruit is a flat thickened pod, 3 to 6 inches long, with a brittle brown shell containing a fibrous juicy pleasantly acid pulp inclosing the seeds. The pulp is used in hot countries to make cooling drinks, and preserved in syrup or sugar, or alone, it forms the tamarinds of commerce. It is used also in preparing tamarind-fish. It is officially recognized as a refrigerant and laxative. Besides the pulp, the seeds, flowers, leaves, and bark all have their medicinal applications in India or elsewhere. The leaves in India form an ingredient in curries. The wood is very hard and heavy, yellowish white in color with purple blotches, and is used in turnery.—**Bastard tamarind**. It is characterized by flowers with colored caducous bracts, four sepals, three perfect and two rudimentary petals, three perfect monadelphous stamens, and a few staminodes in the form of minute teeth; and by the fruit, a thick indehiscent legume with a fragile crustaceous epicarp, pulpy mesocarp, and thick coriaceous endocarp forming partitions between the seeds. The only species, *T. indica*, is widely diffused through the tropics, indigenous in Africa and Australia, and naturalized from cultivation in Asia and America. It is a tree bearing abruptly pinnate leaves, with many pairs of small leaflets, and yellow and red flowers in terminal racemes. See *tamarind*.

It is characterized by racemose or spiked flowers with free or slightly coherent petals, and numerous small smooth seeds without albumen, and terminated by a coma of long plumose hairs. Besides the type, *Tamarix*, it includes the genus *Myricaria*, comprising a few similar but smaller European and Asiatic species growing in sand.

Tamariscineæ (tam-a-ris'in'cæ), *n. pl.* [NL. (A. N. Desvaux, 1815), < *Tamariscus* + *-ineæ*.] An order of plants, the tamarisk family, of the series *Thalamifloræ* and cohort *Caryophyllinæ*. It is characterized by usually shrubby stems clothed with small undivided alternate leaves, and by flowers with five or more stamens, a one-celled ovary with three to five placentæ, and the sepals and petals free or more or less united. It includes about 45 species, belonging to 5 genera classed in 3 tribes, for the types of which see *Tamarix*, *Baccharis*, and *Fouquieria*. They are natives of temperate and warmer regions of the northern hemisphere and also of South Africa, occurring mostly in maritime salt-marshes or in sands and gravelly places among mountains. Unlike the related *Caryophyllaceæ*, or pink family, the seeds are either pilose, comose, or winged, which, together with the frequent willowy habit and narrow leaves, has suggested a superficial resemblance to the order *Salicaceæ*, the willow family. Many species have also been compared to the cypress, from their appressed scale-like leaves and tall slender stems. They are shrubs, rarely herbs or trees, their leaves commonly somewhat fleshy, and their flowers either small or showy, usually flesh-colored, pink, or white.

A plant of the genus *Tamarix*: sometimes called *flowering cypress*. The common tamarisk is *T. Gallica*, a shrub or small tree of the Mediterranean region and southern Asia. It is a prized ornamental shrub of feathery aspect, with scale-like leaves, and bearing clouds of pink flowers in late summer. It is a highly adaptable plant, thriving in wet, dry, or salty ground, rooting readily from slips and pushing forth vigorously; hence it is suitable for planting on shores and embankments. In the northern United States, however, it dies

to the ground in severe winters. The stem and leaves contain much sulphate of soda. A variety produces Jews' or tamarisk manna. (See *manna*.) *T. articulata* (*T. orientalis*) is the chief source of tamarisk-galls, which are said to contain 50 per cent. of tannin, and are used in dyeing and medicine. It is found in northwest India and westward, and is sometimes distinguished as *tamarisk salt-tree*, from its secreting salt which incrusts its trunk in sufficient quantity for some culinary use. It is a bush or tree of coniferous aspect. *T. divica* of India, etc., yields a pale-yellow soluble resin.

They are shrubs, sometimes arborescent, bearing minute scale-like clasping or sheathing leaves. tanager (tan'ā-jēr), *n.* [*< NL. Tanagra*, *q. v.*] Some or any tanagrine bird; a member of the *Tanagridæ*. Few of these numerous brilliant birds are

actually known as *tanagers* except in technical treatises. Those to which the name is chiefly given are the few species which are conspicuous in the woodlands of the United States. These are the common scarlet tanager, or black-winged redbird, *T. coccinea*, and the summer redbird, or rose-tanager, *T. aestiva* (also called *cardinal tanager*). Both of these inhabit the eastern parts of the country to New England and Canada. The male of the former is scarlet, with black wings and tail, the male of the latter is rose red all over, the females of both are greenish and yellow. In western North America are the Louisiana tanager (so called when much of the region west of the Mississippi was known as Louisiana), *T. loricata*, the male of which is yellow and black, with a crimson head, and the hepatic tanager, *T. hepatica*, a dull liver-colored and gray species of the southwest. The foregoing are all 6 or 8 inches long. A tiny and very beautiful tanager, *Euphonia elegans*, which is chiefly blue, yellow, and black, comes from Mexico near or over the southern United States border. (See out under *Tanageridae*.) Throughout all the woodland of tropical and subtropical America tanagers abound, and represent, with the manikins, coatis, and tyrant-flycatchers, the leading passerine birds of these regions. It is not a tanager, but a zuitquit (*Corbidae*).—**Scarlet tanager**, *Piranga rubra*, the black-winged redbird of the United States and warmer parts of America. The adult male is scarlet with black wings and tail, 7 inches long and from 11 to 12 inches in extent.

They have nine primaries, scutellate tarsi, and more or less conirostral bill, which usually exhibits a slight notch. They are confined to America, and almost entirely to the Neotropical region, only one genus (*Piranga*) having any extensive dispersion in North America. They are small birds, the largest scarcely exceeding a thrush in size, and the average length being about 6 inches. They are remarkable even among tropical birds for the brilliancy and variety of the plumage, in

one or both sexes. The *Tanagridæ* are closely related to the finches (*Fringillidæ*), and some of them have the bill as stout as that of a bullfinch; in other cases the bill is slender and acute, approaching that of the American warblers and gnatcatchers (*Mniotiltidæ* and *Corvidæ*). In some instances the bill is strongly notched, and even toothed. The family has never been satisfactorily defined, and is probably insusceptible of exact technical delimitation. It includes several hundred species, of numerous genera. It is divided by Schater into *Procnitidæ*, *Euphoniidæ*, *Tanagrinæ*, *Lamprolariæ*, *Phoenicophilidæ*, and *Pitiliidæ*. Stationary tangent plane of a surface. See *stationary*. **Tangent plane**, a plane which touches a curved surface, as a sphere, cylinder, etc.

II. n. 1. In geom.: (a) A straight line through two consecutive points (which see, under *consecutive*) of a curve or surface. If we take the line through any two points of the locus, and then, while one of these points remains fixed, consider the other as brought by a continuous and not infinitely protracted motion along the locus into coincidence with the former, the line in its final position will be a tangent at that point. The idea of time which appears in this definition is only so far essential that some parameter must be used in order to define a tangent at a singular point, and this parameter must be such as to prevent no discontinuity or point-singularity at that point. A tangent at an ordinary point of a curve or surface may be defined, without the use of any parameter, simply as a line through two points infinitely close together; although, if the doctrine of limits is used to explain away the idea of infinity, a parameter will be used for that purpose. A curve has only one tangent at an ordinary point, or a mere line-singularity, or a cusp, but

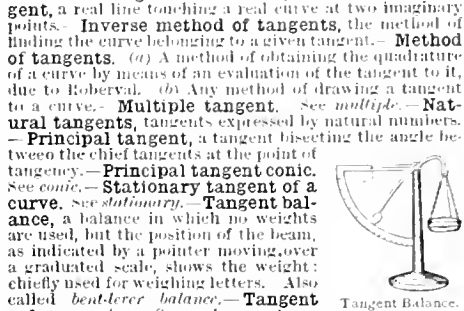

Tangent.—The equation of the curve is $y^2 = (1-x)^2 x^2$. a, ordinary tangent; b, nodal tangent; c, cuspidal tangent; d, inflectional tangent.

has two or more tangents at a node. A surface has a single infinity of tangents lying in one plane at an ordinary point; and two of these (real or imaginary), called the *inflectional tangents*, pass through three or more consecutive points of the surface. On the nodal curve of a surface the tangents lie in two or more tangent planes; at a conical point they are generators of a quadric cone. The tangents of a curve in space form two sets which are all generators of one developable. There are points upon some curves and surfaces at which, according to the doctrine of limits, there are no tangents. Such is the point in the second figure where the two multiple tangents intersect; for, as a second point on the curve moves toward this point, the line through the two points will oscillate faster and faster, without tending toward any limit. In the same sense, a curve may have no tangent at any point; it may be an undulating line with small undulations on the large ones, and still smaller on these, and so on *ad infinitum*, the lengths and amplitudes of the undulations being duly proportioned. But an intelligence situated on such a curve might see that the tangent had a definite direction, for there is no logical absurdity in this. It is antagonistic to the principle of duality which rules modern geometry to define the tangent of a plane curve as the line through two consecutive points on the curve. On the contrary, the definition of a plane curve is a locus described by the parametric motion of a line with a point upon it, the point slipping along the line and the line turning about the point; and such a generating line is a tangent. In like manner, a surface is the locus formed by a plane with a point upon it, the position of the point in the surface and the aspect of the surface about the point varying, the one and the other, according to the variations of the same pair of independent parameters. Such a plane is a tangent plane, and a tangent may equally be conceived as the line through two consecutive inenit-points, or as the line of intersection of two consecutive tangent planes. The tangent plane of a space curve is a line lying in a plane and having a point upon it, the plane turning continuously about the line, the point moving along the line, and the line turning in the plane around the point as a center. Euclid's definition of a tangent ("Elements," bk. iii, def. 2) as a line meeting a circle and not crossing it when produced does not extend to curves having inflections. The definition of the tangent as the limiting case of a secant, which is due to Descartes (but was perfected by Isaac Barrow, 1674), may well be considered as the foundation of modern mathematics. (b) The length cut off upon the straight line touching a curve between the line of abscissas and the point of tangency.—2. In trigonometry, a function of an angle, being the ratio of the length of one leg of a right triangle to that of the other, the angle opposite the first leg being the angle of which the tangent is considered as the function. Formerly the tangent was regarded as a line dependent upon an arc—namely, as the line tangent to the arc at one extremity, and intercepted by the produced radius which cuts off the arc at the other extremity. Abbreviated *tan*.

3. In the clavichord, one of the thick pins of brass inserted in the back ends of the digitals so that the fingers should press them against the

strings, and produce tones. Its action was not like that of the pianoforte-hammer, since it remained in contact with the string, and fixed the pitch of the tone by the place where it struck. It pressed too hard, it raised the pitch by increasing the string's tension. Accordingly the tone of the clavichord was necessarily weak. — **Artificial tangents.** See *artificial*. — **Chief tangent**, a tangent to a surface which is also a tangent of the intersection of the surface by the tangent plane at the same point of tangency. — **Conjugate, cotiple, double, imaginary, inflectional tangent.** See the adjectives. — **Ideal tangent**, a real line touching a real curve at two imaginary points. — **Inverse method of tangents**, the method of finding the curve belonging to a given tangent. — **Method of tangents.** (a) A method of obtaining the quadrature of a curve by means of an evaluation of the tangent to it, due to Roberval. tanistry (tan'is-tri). *n.* [*< tanist + -ry; see -ry.*]
A mode of tenure that prevailed among various
Celtic tribes, according to which the tanist, or
holder of honors and lands, held them only for
life, and his successor was fixed by election.
According to this custom the right of succession was not
in the individual, but in the family to which he belonged—
that is, succession was hereditary in the family, but elec-
tive in the individual. The primitive intention seems to
have been that the inheritance should descend to the
oldest or the most worthy of the blood and name of the
deceased. This was in reality giving it to the strongest,
and the practice often occasioned bloody wars in families.

I have already called it *Tanistry*, the system under which
the grown men of the tribe elect their own chief, gener-
ally choosing a successor before the ruling chief dies, and
almost invariably electing his brother or nearest mature
male relative. *Maine, Early Law and Custom, p. 145.*

tannic (tan'ik), *a.* [*<* *tan* + *-ic*.] Pertaining to or derived from *tan*.—**Tannic acid**, tannin, a white uncrystallizable odorless substance, $C_{12}H_{10}O_6$, having a most astringent taste, without bitterness. It is very soluble in water, much less so in alcohol. It has an acid reaction, and combines with most salinable bases. It precipitates starch, albumin, and gelatin, and forms with gelatin a very insoluble compound which is the basis of leather, and on which the art of tanning is founded. The word *tannin* has been loosely applied to all astringent vegetable principles. Commercially, tannic acid is of two kinds—*gallotannic acid*, derived from nutgalls, and *quercitanic acid*, which occurs in healthy leaves and bark. Gallotannic acid is the kind chiefly used. In medicine it is used internally as an astringent and externally as an astringent and styptic. Also called *tannin* and *digallie acid*.—**Tannic-acid ointment.** See *ointment*.

tanning (tan'ing), *n.* [Verbal *n.* of *tan*, *v.*]

1. The art or process of converting hides and skins into leather; the manufacture of leather. The process is chiefly chemical, and depends essentially upon the action of tannic acid, gallic acid, alum, sulphates of iron and copper, salt, and other agents on the gelatin, gluten, albumin, and other constituents of animal skins. Strictly, tanning is the treatment of hides with tannin, or tannic acid; the treatment of hides with alum and other minerals is called *taurina* (which see). In tanning proper, raw, salted, and dried hides of cattle are treated with some form of tannin, either by itself or in connection with other agents, and the product is called *leather* to distinguish it from the *white* or *alum leather*, *kid*, *tanbuckin*, etc., produced from the skins of goats, sheep, and other small animals. While a great number of plants yield tannin, the chief source of it is the bark of the oak, hemlock, birch, and beech, and the powdered leaves and young shoots of the sumac. Nutgalls are also used, as they carry gallic acid with the tannic acid. Many other vegetable matters are also used. The treatment of the hides in tanning is essentially a steeping or soaking in baths formed of extracts of tannin either by placing the ground bark directly in the baths, or by employing fluid extracts of the barks or sumacs. The hides are first freed from hair and fleshed, and are then placed in the baths. The art of tanning also includes the mechanical and chemical treatment of the hides to make them supple and water-proof. See *leather*, *v.* 2. An appearance or hue of a brown color produced on the skin by the action of the sun.

Diseases and distempers incident to our faces are industriously to be cured without any thought or blame of pride; as flushings, redness, inflammations, pimples, freckles, ruggedness, *tannin*, and the like.

tan-ooze (tan'ōz), *n.* In *tanning*, an aqueous extract of tan-bark, as hemlock or oak-bark or mixtures of these barks, or of other vegetable substances or mixtures of such substances with one another or with tan-bark, used in tanning. The ooze also usually contains in a suspended state the material or mixture of materials from which the water dissolves out the tannin making the extract; and, after the more or less prolonged immersion of the hides or skins, the latter absorb a large proportion of the extracted tannin, and the ooze becomes somewhat shiny from animal matters. Also called *tannop*.

tan-pickle (tan'pik), *n.* The liquor of a tan-pit: same as *tan-ooze*.

The charge to the public was less than it had been when the vessels were unseaworthy, when the sailors were riotous, when the food was alive with vermin, when the drink tasted like *tan-pickle*, and when the clothes and hammocks were rotten.

One of the rare metals occurring in various combinations, but hardly known at all in the separate metallic state. As prepared by Berzelius, but not entirely pure, it appeared as a black powder, which assumed a grayish me-

tallie luster under the burnisher, and which when gently heated took fire, and burned to an oxid. It was discovered by Ekeberg, in 1802, in the mineral afterward named by him *ytrotantalite*, and it has since been found in various rare minerals, as tantalite, columbite, pyrochlore, fergusonite, etc., in which it is almost always associated with niobium. It also occurs in small quantities in various tin, tungsten, and uranium ores. In its chemical relations it is allied to bismuth, antimony, and niobium.

It is known in Arizona and southern California as the *Colorado turkey* (or *water-turkey*), from the Colorado river. (See *wood-ibis*.) Tantalus cup. A philosophical toy, consisting of a siphon so adapted to a cup that, the short leg being in the cup, the long leg may go down through the bottom of it. The siphon is concealed within the figure of a man, whose chin is on a level with the bend of the siphon. Hence, as soon as the water rises up to the chin of the figure it begins to subside, so that the figure is in the position of Tantalus, who in the fable (see *tantalize*) is unable to quench his thirst.

tape-work (täp'wërk), *n.* A kind of ornamental
 work consisting of knots, rosettes, etc., made
 of tape, and connected together by braid or
 cord, arranged in varied patterns and sewed
 strongly into a continuous texture, or else
 worked with the crochet-needle to form a back-
 ground to the figures made by the tape.

tapeworm (täp'wërm), *n.* An entozoic para-
 sitic worm, of flattened or tape-like form and
 indeterminate length, consisting of many sep-
 arable joints, found in the adult state in the ali-
 mentary canal of most
 vertebrate animals.
 Such worms belong to the
 order *Cestodea* or *Teninia*,
 family *Tenidae*, and several
 different genera, especially *Teni-*
nia, the true tapeworms, and
Bothriocephalus, the broad
 tapes. The so-called "head"
 of a tapeworm, small and in-
 conspicuous in comparison
 with the great length to which
 the body may attain, is the whole
 of the real worm, all the rest
 of the joints being merely suc-
 cessive generative buds, which
 contain the matured sexual
 elements, and are technically
 called *proglottides*. They are
 continually budded off from
 the head, the oldest joint being
 the one furthest from the head;
 and any number of them may
 be broken off and expelled
 from the body without stopping
 their continual gemination.
 This is why no tapeworm can
 be eradicated unless the head
 is expelled from the host.
 The chain of links or joints is
 the strobila; it may consist
 of several hundred generative
 buds, and grow to be several
 yards long. These formidable
 parasites are parenchyma-
 tous, having no mouth nor alimen-
 tary canal, and live
 by absorbing nourishment from
 the host, so that persons thus
 parasitized may suffer from
 defective nutrition while acquir-
 ing a ravenous appetite.
 The head of the tape is pro-
 vided with hooks or suckers,
 or both, for adhering to the
 mucous membrane of the host.
 The ova, matured in every one
 of the joints, do not com-
 plete their development in the
 animal in which the adult
 exists. They require to be
 swallowed by some other ver-
 tebrate, the ripe proglottides
 being expelled from the bow-
 el of the host with all their
 contained ova fertilized. The
 segments or proglottides de-
 compose and liberate the
 ova, which are covered with a
 capsule. After being swal-
 lowed the capsule bursts, and
 an embryo, called a *proso-*
plex, is liberated. This embryo,
 by means of spines, perforates
 the tissues of some contiguous
 organ, or of a blood vessel,
 in the latter case being car-
 ried by the blood to some solid
 part of the body, as the liver
 or brain, where it surrounds
 itself with a cyst, and devel-
 ops a vesicle containing a fluid.
 It is now called a *scolex* or
hydratid, and was formerly
 known as the *cystic worm*.
 The scolex is incapable of
 further development till
 swallowed and received a
 second time into the ali-
 mentary canal of a vertebrate.
 Here it becomes the head of
 the true tapeworm (see *Tenia*
head), from which proglottides
 are developed posteriorly by
 gemination, and the adult
 animal with which the cycle
 began is thus reached. (See
 cut under *Tenia*.) At least
 eight tapeworms, mostly of
 the genus *Tenia*, are found
 in man. The pork tapeworm,
 which in its cystic form (the
 so-called *Cysticercus cellu-*
losus) in the pig produces the
 disease measles (see *measles*,
 2); it is acquired by those who eat

merely pork, or raw sausage, made with such pork. The
 best tapeworm is *T. mediceana* (Linn.). The Egyptian dwarf tapeworm
 is *T. mediceana*; others are the dilute-pointed *T. dilipica*; the
 spotted *T. lophocoma*; the spotted *T. plerocoma*. A dog
 tapeworm is *T. canis*, its larva, called *Cysticercus plerocoma*,
 is the parasite of the rabbit. Another dog tapeworm is *T.*
canis, whose larva is the cystic worm, *Cysticercus cellu-*
losus, of the sheep brain, producing the grid or staggers. A
 third dog tapeworm is *T. echinococcus*, whose larva, known as
Echinococcus echinococcus, is a common hydatid sand found
 in man. *T. macracanthus* of the dog is the tapeworm
 from the slender hydatid *Cysticercus tenuicollis* of the
 sheep. A cysticercus of the mouse becomes *T. muris*,
 visible in the cat. Certain cysticercus of moles become in
 the fox *T. tanais* and *T. crassiceps*. The larval
 tapeworm of man is *Bothriocephalus*, also called *Sco-*
lex tapeworm, and another human parasite of this genus is *E.*
hydratid. Tapes are also called *ribbons*, *worms*. See cut
 under *Cestodea*, also *canis*, *cysticercus*, *echinococcus*,

 tion-furnace, a small hole in one end of each
 pot, opposite to which is a hole in the furnace-
 wall, used for the insertion of "trial" or "tap"
 bars, so placed as to be accessible for ready
 withdrawal and inspection during the cemen-

A conical cavity is dug in the side of a bank or a steep hill, and a cast-iron pan is placed at the bottom, from which leads a spout into a barrel for collecting the tar. Billets of wood (such as pine or fir) are thrown into this cavity, and being covered with turf, are slowly burned without flame. The wood which is used in Europe is that of the Scotch pine, *Pinus sylvestris*, and the Siberian larch, *Larix sibirica*; in the United States that of the long-leaved pine, *Pinus palustris*. Most of the tar produced in the United States is made in North Carolina, Virginia, and Georgia. In England wood-tar is chiefly obtained as a by-product in the destructive distillation of wood for the manufacture of wood-vinyl (pyrolytic acid) and wood-spirit (methyl alcohol). It has an acid reaction, and contains various liquid matters, of which the principal are methyl-acetate, acetone, hydrocarbons of the benzene series, and a number of oxidized compounds, as carbolic acid. Paraffin, anthracene, naphthalene, chrysene, etc., are found among its solid products. It possesses valuable antiseptic properties, owing to the creosote it contains, and is used extensively for coating and preserving timber and iron in exposed situations, and for impregnating ships' ropes and cordage. Coal-tar is extensively obtained in the process of gas-manufacture. It is a very valuable substance, the compounds obtained from it forming the basis of many chemical manufactures. See *coal-tar*.

Modern targets for long-range practice with the rifle are made of metal, and the compartments are usually square, one within the other; the target for practice with cannon is generally intended to test the penetrating power of the projectile, and is accordingly built up in imitation of the side of a ship, or of a turret.

A list or table of goods with the duties or customs to be paid on them, either on importation or on exportation; a list or table of duties or customs to be paid on goods imported or exported. 2. A duty, or the duties collectively, imposed according to such a list, table, or scale.—3. A table or scale of charges generally; as, a telegraph *tariff*.—4. —**Walker tariff**, in *U. S. hist.*, a tariff established by an act passed in 1846, in accordance with principles laid down by Robert J. Walker, Secretary of the Treasury. It classified all articles under eight schedules, and greatly reduced the duties from the tariff of 1842. Its rates were still further reduced by the act of 1857.

—**Wilson tariff** (from William L. Wilson, chairman of the Ways and Means Committee), the tariff established by the act of 1894. It made the average rate of duties somewhat lower than that which resulted from the McKinley tariff. The most important provision of the act was the free importation of raw wool. taro (tär'ró), *n.* [Also *tara*; *< Polynesian taro*.]

A food-plant, *Colocasia antiquiorum*, especially the variety *esculenta*, a native of India, but widely cultivated in the warmer parts of the globe, particularly in the Pacific islands. It is a stemless plant with the general habit of the calladiums of house and garden culture. The leaves are heart-shaped and about a foot long. Its chief value lies in its stem-like tuberous starchy root, which is eaten boiled or baked, made into a bread or pudding, or in the Sandwich Islands, where it is the staple food of the natives, in the form of poi (which see). The tubers, when baked, pounded, and pressed, keep fresh many months. An excellent starch can be had from them. The leaves and leafstalks are also edible, with the character of spinach or asparagus. All parts of the plant are acrid, but this quality is removed by cooking. Taro is propagated by a cutting from the top of the tuber, which, in the Fiji Islands at least, is planted as soon as the crop is gathered. About fifteen months are required to mature the root. See *Colocasia* (with cut), also *cocco*, *eddoes*, and *tanya*.

One of a pack of playing-cards first used in Italy in the fourteenth century, and so named from the design of plain or dotted lines crossing diagonally on the back of the cards. The original pack contained seventy-eight cards—namely, four suits of ten numerical cards, as in the modern game, with four coat-cards (king, queen, chevalier, and valet) in each suit, and a series of twenty-two attenti or atouts, these last being the trumps, and known specifically as the *tarots*.

tarpan (tär'pan), *n.* [Tatar name.] The wild horse of Tatar, belonging to one of those races which are by some authorities regarded as original, and not descended from domestic animals. Tarpans are not larger than an ordinary mule, are migratory, and have a tolerably acute sense of smell. Their color is invariably tan or mouse, with black mane and tail. During the cold season their hair is long and soft, lying so close as to feel like a bear's fur, and then it is grizzled; in summer it falls much away, leaving only a quantity on the back and loins. They are sometimes captured by the Tatars, but are reduced to subjection with great difficulty.

Same as *palpebral ligament* (which see, under *palpebra*).—**Tarsal ossicle, sinus, etc.** See the nouns.—**Tarsal system**, a system of classification, proposed by Olivier and adopted by Latreille and other eminent entomologists, by which all coleopterous insects were arranged in sections in conformity to the real or supposed number of joints in their tarsi. These sections, as proposed by Olivier, were (1) *Pentamera*, having five joints to all the tarsi; (2) *Heteromera*, having the four anterior tarsi five-jointed and the two posterior four-jointed; (3) *Tetramera*, having four joints to all the tarsi; (4) *Trimeria*, having three joints to all the tarsi. To these Latreille added (5) *Dimeria*, having two joints to all the tarsi, and (6) *Monomera*, having but a single tarsal joint in each foot. Some of these divisions are now known to have rested on imperfect observations, and all are subject to exceptions among closely allied species; hence the tarsal system has been generally abandoned or modified, though in many respects it approached a natural classification, and, admitting the exceptions, the divisions can still be used with advantage. Its convenience is such that attempts have also been made to retain it, in its general features, with substitution of other names intended to correct the early imperfect observations, as *Cryptopentamera*, *Pseudotetramera*, *Subpentamera*, etc.; and the adjectives derived from all these terms, as *pentamerous*, *heteromerous*, etc., are regularly used in describing beetles and their tarsi.

The tarsus is thus about as long as all the rest of the foot, and much longer than the metatarsus. The condition of the parts is unique among mammals, though approached in some of the galagos (of the genus *Otilotus*). The tarsier is a small nocturnal lemur of slender form, with long hind legs, very long slender tail tufted at the end, fingers and toes padded at the ends like a tree-frog's, and very large eyes. tarsus.] The single compound bone of some animals, especially birds, resulting from the combination of tarsal and metatarsal bones in one. This formation occurs in all birds and probably some reptiles. In the former the three principal metatarsal bones fuse into one, the fourth metatarsal remaining distinct or only incompletely joined to the rest; and to the proximal extremity of the compound metatarsal thus formed are also ankylosed the elements of the distal tarsal series. The result is similar to that seen in the compound cannon-bone of hoofed quadrupeds, though this has no tarsal elements. The tarsometatarsus is a comparatively large stout bone, extending from the heel or sufragio to the bases of the toes. It corresponds to that part of the foot commonly called the *tarsus* in descriptive ornithology, and is usually naked and scaly, though sometimes feathered. Its proximal extremity usually presents a large bony protuberance (the so-called calcaneum or hypotarsus), perforated for the tendons of certain muscles, and the distal extremity is divided into three prongs (two in the ostrich), each bearing an articular surface for one of three toes (the first toe, or hallux, when present, being differently attached to the foot by an accessory metatarsal).

The bone is nearly always compressed, or of less width than depth; but in the penguins it is broad from side to side and shows two fontanelles, or vacant spaces, indicating its triple composition. It is often called simply *metatarsus*, its tarsal elements being ignored. See also cut under *metatarsus*.

[= *F. tarse, < NL. tarsus, < Gr. τάρσιος, any broad flat surface, as for warming or drying things upon (τάρσιος πῶδος, the flat of the foot), < τέρεσθαι, dry, dry up: see terra, thirst.*] **1.** In *zool.* and *anat.*, the proximal segment of the pes or foot, corresponding to the carpus of the manus or hand; the collection of bones between the tibia and the metatarsus, entering into the construction of the ankle-joint, and into that part of the foot known in man as the instep. It consists in man of seven bones: the astragalus or hucklebone, alone supporting the leg; the calcaneum, or calcis, or heel-bone; the scaphoid or navicular bone; the cuboid, supporting the two outer metatarsals; and three cuneiform bones, supporting the other three metatarsals. The tarsal bones tend to arrange themselves in two rows, called the *proximal* and *distal* rows; in man the first three just named belong to the proximal row. A generalized tarsus, as found in some reptiles, consists of nine tarsal bones: an outer proximal, the fibulare; an inner proximal, the tibiale; one between these, the intermedium; a central one, the centrale; with five in a distal row, one for each metatarsal, called *tarsalia*, and distinguished as tarsale I-V from inner to outer side. Various suppressions, confluences with one another or with other bones, or additions to the number occur, destroying the symmetry of the typical tarsus; but seven is the normal mammalian number, as in man, where the astragalus is supposed to = the tibiale - intermedium; the calcaneum = fibulare; the scaphoid = centrale; the cuboid = tarsalia IV + V; the three cuneiforms = tarsalia I, II, III. In all *Mammalia* the ankle-joint is between the tarsus and the tibia, or tibiotarsal; in all vertebrates below *Mammalia* which have a tarsus the ankle-joint is among the tarsal bones, between the proximal and distal rows, and therefore mediotarsal. Birds offer the most exceptional case, there being apparently no tarsus, or tarsal bones, in the adult. This appa-

4. The sense by which the relish or savor of a thing is perceived when it is brought into immediate contact with special organs situated within the cavity of the mouth. The tongue is also supplied with nerves of common sensation or touch, and in some cases it is difficult to distinguish between such a sensation and that arising from the exercise of the sense of taste.

—**Syn.** 3. *Taste, Savor, Flavor, Smack.* *Taste* is the general word, so far as the sense of *taste* is concerned; as, the *taste* of an apple may be good, bad, strong, woody, earthy, etc. *Savor* and *flavor* may apply to the sense of *taste* or to that of smell. *Savor* in *taste* generally applies to food, but is otherwise rather indefinite: as, to detect a *savor* of garlic in soup. *Flavor* is generally good, but sometimes bad: it is often the predominating natural *taste*: as, the *flavor* of one variety of apple is more marked or more palatable than that of another. *Smack* is a slight *taste*, or, figuratively, a faint smell, generally the result of something not disagreeable added to the thing which is tasted or smelled: as, a *smack* of vanilla in ice-cream; a *smack* of salt in the sea-breeze.—6. *Taste, Sensibility.* *Taste* is active, deciding, choosing, changing, arranging, etc.; *sensibility* is passive, the power to feel, susceptibility of impression, as from the beautiful.—7. *Taste, Judgment.* As compared with *judgment*, *taste* always implies esthetic sensibility, a sense of the beautiful, and a power of choosing, arranging, etc., in accordance with its laws. *Judgment* is purely intellectual. Skeat also quotes a passage from Udall, tr. of "Erasmus's Apophthegms," Diogenes, § 68, "Geynyng vnto the same *taunt pour taunte*, or one for another," suggesting an origin in the F. phrase *taut pour tant*, 'so much for so much': see *tautity*. There is no evidence that the sense was affected by OF. *tanter*, *tanter*, *tensor*, F. *tanter*, check, scold, reprove, *taunt*, < ML. as if "*tentare*, from the same source as *tentare*."] 1. Originally, to tease; rally; later, to tease spitefully; reproach or upbraid with severe or insulting words, or by casting something in one's teeth; twit scornfully or insultingly.

Heywood, Hierarchy of Angels, p. 10.

=**Syn.** 1. *Ridicule*, *Chaff*, *Deride*, *Mock*, *Upbraid*, *Taunt*, *Flout*, *Trit*. We may *ridicule* or *chaff* from mere sportive-ness; we may *ridicule* or *upbraid* with a reformatory purpose; the other words represent, and all may represent, an act that is unkind. All except *mock* imply the use of words. As to *ridicule*, see *ludicrous*, and *banter*, *v.* and *n.* *Chaff*, which is still somewhat colloquial, means to make fun of or tease, kindly or unkindly, by light, ironical, or satirical remarks or questions. *Deride* expresses a hard and contemptuous feeling: "*derision* is ill-humored and scornful; it is anger wearing the mask of *ridicule*" (*C. J. Smith, Syn. Disc.*, p. 667). It is not always so severe as this quotation makes it. *Mock* in its strongest sense expresses the next degree beyond *derision*, but with less pretense of mirth (see *imitate*). We *upbraid* a person in the hope of making him feel his guilt and mend his ways, or for the relief that our feelings find in expression; the word is one degree weaker than *taunt*. To *taunt* is to press upon a person certain facts or accusations of a reproachful character unsparingly, for the purpose of annoying or shaming, and glorying in the effect of the insulting words: as, to *taunt* one with his failure. To *flout*, or *flout at*, is to *mock* or insult with energy or abruptness: *flout* is the strongest of these words. To *trit* is to *taunt* over small matters, or in a small way; *trit* bears the relation of a diminutive to *taunt*.

taunt¹ (tānt or tānt), *n.* [Also dial. *taut*; < *taunt*¹, *v.*] 1. Upbraiding words; bitter or sarcastic reproach; insulting invective.

— **Capitation tax**, a poll-tax. — **Collateral-inheritance tax**. See *collateral*. — **Diffusion of taxes**. See *diffusion*. — **Income tax**. See *income*. — **Inheritance tax law**. See *inheritance*. — **Poll tax**. See *poll-tax*. — **Single tax**, in economics, taxation solely on land-value, to the exclusion of other taxation by the same state. According to the theory advocated in recent times by Henry George and others, this tax should supersede all others, and should fall only on valuable land, exclusive of the improvements on such land.

The single tax, in short, would call upon men to contribute to the public revenues not in proportion to what they produce or accumulate, but in proportion to the value of the natural opportunities they hold. It would compel them to pay just as much for holding land idle as for putting it to its fullest use.
Henry George, Single Tax Platform.

Succession tax. See *succession*. — **Tax commissioner**, in certain of the United States, an officer, generally one of a board, charged with the valuation of property and assessment of taxes thereon. — **Tax deed**, a deed by which the officer of the law undertakes to convey the title of a former owner of land, sold by the state or a municipality for unpaid taxes, to the purchaser at the tax-sale. — **Tax lease**, a lease used where, instead of selling the fee, the state sells a term of years in the land. — **Tonnage tax**, a tax on vessels, usually measured by the tonnage of the vessel, sometimes imposed as a fee for entering the port, irrespective of any service received, but as a compensation for the privilege of entering and anchoring; a kind of tax which the States are prohibited by the United States Constitution from imposing, as distinguished from pilotage, quarantine, and similar dues imposed with reference to a service rendered or tendered. — **Wheel tax**, a popular name for a tax upon carriages. — **Window tax**. See *window*. — **Syn. 2. Tax, Impost, Duty, Customs, Toll, Rates, Excise, Assessment, Tribute**. Tax is the general word for an amount demanded by government for its own purposes from those who are under its authority. *Imposts, duties, and customs* are levied upon imports or exports, but *impost* applies to any tax viewed as laid on. *Toll* and *rates* are certain local taxes: as, toll at a bridge, ferry, or plank-road; church-rates and poor-rates in England, water-rates. *Excise* is a precise word in England (see def.); its most frequent use is in connection with malt and spirituous liquors. *Assessment* is either (a) the valuation of property for the purpose of its taxation; (b) the imposing of the tax; or (c) a charge on specific real property of a share of the expense of a local improvement specially benefiting that property. *Tribute* views the tax as laid not for the public good, but arbitrarily for the benefit of the one levying it, especially a conqueror: as, "Millions for defense, but not one cent for tribute." Each of these words had its older, peculiar, or figurative uses. See definitions of the words, and also of *subsidy*.

As constituted by Eichler, it includes 15 or 20 species of 5 genera, mostly of northern temperate regions. It is characterized by dioecious flowers, the pistillate in aments of imbricated scales, of which several or only the terminal one is fertile, and by a solitary erect or afterward oblique ovule which is surrounded or partly inclosed by the hollowed apex of a sessile or stalked lamina free from its accompanying bract. The genus *Ginkgo* is exceptional in bearing an ovule on each lobe of a two- to six-parted lamina, *Cephalotaxus* in its small adnate lamina with twin ovules, and *Phyllocladus* in its monocious flowers. In a perfectly taxeopod foot each of the distal tarsal bones would articulate by its whole proximal surface with the distal surface of one bone of the proximal row. It is characterized by a globose or obovoid cone composed of scales with an entire margin, at the apex woody, dilated, and truncate, on the back umbonate or mucronate, and including the two irregularly three-angled seeds, which contain six to nine cotyledons. There are two species, natives of the United States and Mexico. They are loosely branched

Taxodium distichum.

closely crowded with spirally set scales. The fruit is a hard round cone, an inch long, with its very thick angular petaloid stalks gaping apart at maturity, but persistent after the fall of the seeds, which are large, shining, and coriaceous or corky on the surface. *T. distichum*, the bald or red cypress of the United States, is characteristic of southern swamps near the sea-coast, occupying large tracts to the exclusion of other trees, and extending often into deep water around lake-margins. It occurs from Delaware to Texas, and also in the Mississippi and Ohio valleys to Indiana and Illinois. It often reaches a great size, sometimes 150 feet in height and 36 in girth, and furnishes a valuable wood which is soft, close, easily worked or split, and very durable, and is much employed for coopersage, railway-ties, fences, posts, and shingles. It is almost indestructible in water or in contact with earth, but is often injured, especially beyond the Mississippi, by a fungus, a species of *Dothidea*. Two varieties are distinguished by lumbermen—the *white cypress*, with light-brown wood, and the *black cypress*, with dark-brown harder and more durable wood at first heavier than water; the sap-wood of both is nearly white. The tree is also the source of an essential oil, a superior turpentine, and a medicinal resin, and from the beauty of its leathery foliage it is valued for lawn cultivation. It is especially remarkable for its habit, when growing under water, of throwing up large smooth conical projections known as *cypress-knees*, commonly 2 (sometimes 7) feet high, covered with reddish bark like the roots, and hollow, as is the base of the tree itself. They are by some supposed to be aerating organs, by others to serve as braces to afford a stable lateral support in the yielding bottom, and by others to be undeveloped or arrested tree-trunks. (Compare *cypress-knee*, *knee*, 30d, and *cypress*.) The tree itself often rises out of water as a straight gray shaft 50 or 90 feet high before dividing into its flat spreading top, its base ribbed by large projecting buttresses, each continuous below with a strong and branching root, from horizontal branches of which the knees arise. The tree is also remarkable for its great longevity, growing rapidly at first, in cultivation sometimes adding an inch in diameter a year, but soon becoming as slow-growing as the yew, and adding only an inch in twelve to thirty years. The other species, *T. mucronatum*, the Mexican cypress, or ahuehete, forms extensive forests in the Sierra Madre, at elevations from 4,000 to 9,000 feet, itself often reaching 70 to 100 feet high, with longer and pendulous branchlets and more persistent greener leaves. It attains even a greater size and age than *T. distichum*; the celebrated *cypress of Montezuma*, in the gardens of Chapultepec, variously estimated from 700 to 2,000 years old, is 41 to 45 feet in girth and about 120 feet high; one at Atlitico is about 76 feet, and another, near Oaxaca, 112 feet in girth; the latter was estimated by A. de Candolle and Asa Gray to be at least 4,000 years old. A third species, *T. heterophyllum* (for which see *water-pine*, under *pine*), is now separated as *Glyptostrobus heterophyllum*, on account of its obovoid cone and stalked seeds. The genus is of great antiquity geologically, being found in the Cretaceous and in great abundance in the Tertiary of nearly all parts of the world.

Invert.*, p. 561.

Taxis (tak'sus), *n.* [NL. (Tournefort, 1700), *< L. taxis = Gr. taxis*, a yew-tree]. A genus of conifers, the yews, type of the tribe *Taxææ* and suborder *Taxaceæ*. It is characterized by mostly dioecious flowers, the female solitary and consisting of a single erect ovule on a small annular disk, which soon becomes cup-shaped and fleshy, and finally forms a pulpy berry enclosing the seed, but free from it and open at the truncate apex. The small globose male flowers are solitary in the axils, surrounded by a few imbricated scales, with a short stalked stamen-column, five to eight roundish depressed and furrowed anthers, which become almost umbrellashaped and four- to six-lobed after maturity, and bear three to eight cells connate into a ring. The ripened seed is hard, woody, and nut-like, somewhat viscous when fresh, and contains an embryo of two cotyledons. There are 6 or 8 species, by some considered all varieties of one, natives all of the northern hemisphere and widely dispersed. They are evergreen trees or shrubs, bearing short-petioled flat linear rigid leaves which are somewhat spirally inserted, but usually spread falcately into ranks. The genus is remarkable for the great variation within the same species, *T. mucronata*, the yew, seldom exceeding 15 or 20 feet in height in England, but in the Himalayas becoming a naked trunk 30 feet high and often 16 in girth, its top reaching 70 or, it is said, sometimes 100 feet in height. *T. brevifolia* is similarly a low shrub in Montana, but a stately tree sometimes 75 feet high near the Pacific. *T. canadensis*, the ground-hemlock, formerly regarded as a variety of the British species, usually a prostrate shrub, extends from New Jersey and Iowa northward, generally under evergreens. The other North American species, *T. floridana* of West Florida and *T. globosa* of Mexico, are small trees, as are those of Japan, where *T. cuspidata* is cultivated and many curious varieties have been produced. The genus is similar to *Taxodium* in its slow growth, and remarkable for the great bulk attained by older trees, as the celebrated Ankerwyke yew near Staines, in England, within sight of which the Magna Charta was signed, which is 27½ feet in girth; the Tisbury yew in Wilts, 37 feet; and the Fortingall yew in Perthshire, 5½; the first of these was estimated by Asa Gray to be at least 1,100 years old, and the second 1,400. It was a modification of the earlier New England Calvinism, in that it insisted upon a real freedom of the will, a natural ability of moral choice, and a distinction between depravity as a tendency to sin and sin itself, the latter consisting wholly in a voluntary choice of evil. It was sharply opposed to Tylerism.

Puritan theology had developed in New England into Edwardism, and then into Hopkinsianism, Emmonsism, and Taylorism. *Encyc. Brit.*, XIX. 700.

G. *thee* = Sw. *Dan*, *te* = NGr. *τῆ* (NL. *thea*). prob., through Malay *te*, *trh*, *Ch* Chinese (Fukien dial.) *te* (pron. tā); (b) *cha*, *chau*, *chau*, *cia* = Pg. *chá* = Sp. (esp. Amer. A product consisting of the prepared leaves of the tea-plant (see def. 2), of various kinds and qualities depending chiefly on the method of treatment. Black tea is manufactured by a process of withering under the influence of light, heat, and air, rolling, fermenting, sunning, and firing (heating with charcoal in a sieve); green tea by a more rapid process without the withering and fermenting, and with more firing. Among the chief black teas are *bōhea*, *congou*, *souchong*, *caper-tea*, *oolong*, and *pekoe*; among the green, *twankay*, *hyson skin*, *young hyson*, *hyson*, *imperial*, and *gunpowder*. The gunpowder is the finest green, the pekoe the finest black, both being made from the first pickings—*flowering pekoe* from leaves so young as to be still covered with down. A third group of teas is known as the *scented*, generally of poorer quality,

flavored with the flowers of the fragrant olive (see *Osmantbus*), of the chulan, and sometimes of the Cape jasmine (see *Gardenia*) and of other plants. This classification applies more especially to Chinese teas. Tea became known in Europe during the seventeenth century. Among western nations the greatest consumers of tea are Great Britain, Russia, and the United States.

2. The tea-plant, *Camellia theifera*, often named *Thea sinensis* (or *Chinensis*). The tea-plant is a shrub from 3 to 6 feet high, with leaves from 4 to 8 inches long and from 1 to 2½ inches broad, and tapering toward both ends; the flowers are white, and about 1½ inches broad. The cultivated plant is of a more contracted habit, with smaller, more obtuse, and leathery leaves. The plant is known to grow wild in upper Assam, the form there found having sometimes been distinguished as *Thea Assamica*, forming, with its varieties, Assam tea. The Assam plant is much superior to the Chinese, and the teas most planted are hybrids of the two. The Chinese tea has two varieties, formerly distinguished as *Thea Bohen* and *T. viridis*, black and green tea; but either kind of tea can be made from either plant. China is the great seat of tea-culture; but tea is also extensively grown in Japan, having been

introduced in the reign of Saga Tennō (A. D. 810-23), also in India and Java. Promising experiments have been made in Madagascar, Natal, Jamaica, etc. In the United States it can be grown successfully in the South and in California; but the cost of labor has thus far prevented its economic success.

3. An infusion of the prepared leaves of the tea-plant, used as a beverage, in Great Britain and America commonly with the addition of a little milk or sugar, or both, in continental Europe often with a little spirit, in Russia with lemon, and in China and neighboring countries without any admixture. Its action is stimulating and invigorating, and, owing to the presence of tanning, more or less astringent. Its main quality depends upon the alkaloid thein; the leaf contains also volatile oils, which give it its fragrance, and some other substances. Excessive use, especially of green tea, affects the nervous system unfavorably. While tea contains but trifling nutriment, it is held to retard the waste of the tissues and diminish the need of food.

That excellent and by all physicians approved China drink called by the Chinese *Tcha*, and by other nations *tap*, alias *tee*, is sold at the Sultana Head Coffee House, London.

Mercurius Politicus, Sept. 30, 1658.

Cibber, *Lady's Last Stake*, i. 1.

4. A similar infusion of the leaves, roots, etc., of various other plants, used either medicinally or as a beverage: generally with a qualifying word. See phrases below.—5. A drop or small quantity of the limpid fluid secreted by the lacrimal gland, appearing in the eye or falling from it; in the plural, the peculiar secretion of the lacrimal gland, serving to moisten the front of the eyeball and inner surfaces of the eyelids, and on occasion to wash out the eye or free it from specks of dirt, dust, or other irritating substances. Tears, like saliva, are continually secreted in a certain quantity, which is speedily and copiously increased when the activity of the gland is excited either by mechanical stimulation or by mental emotion. Any passion, tender or violent, as joy, anger, etc., and especially pain or grief, may excite the flow of tears, which is also immediately provoked by pain, especially in the eye itself. The tears ordinarily flow unperceived through the lacrimal canal or nasal duct into the nose; when the supply is too copious they overflow the lids and trickle down the cheek. Tears consist of slightly saline water, having an alkaline reaction.

She whassched his feet with hire *Teres*, and wyped hem with hire *Heer*. *Manderley*, Travels, p. 97.

It is observed, for instance, that when a wine-glass partially filled with port wine is allowed to stand, the alcohol evaporates more rapidly than the water present with it; hence the latter tends to increase in proportion, and because of its higher surface-tension creeps up on the surface of the glass, dragging the other liquid with it, till drops are formed which roll down the sides again.

= *Syn.* 3. *Tease*, *Vex*, *Annoy*, *Molest*, *Badger*, *Pester*, *Bother*, *Worry*, *Plague*, *Torment*. All these words either may or must refer to repeated acts; they all suggest mental pain, but of degrees varying with the word or with the circumstances; all except *badger* and *molest* may be used reflexively, but with different degrees of appropriateness, *vex*, *worry*, and *torment* being the most common in such use; the agent may be a person, or, except with *badger*, it may be a creature, events, circumstances, etc.; it would be clearly figurative to use *tease* when the agent is not a person; all except *tease* are always used seriously. *Tease* is not a strong word, but has considerable breadth of use; a child may *tease* his mother for what he desires; there is a great deal of good-humored *teasing* of friends about their matrimonial intentions; a fly may *tease* a dog by continually waking him up. *Vex* is stronger, literally implying anger and figuratively applying to repeated attacks, etc., such as would produce an excitement as strong as anger. In *Shakespeare's* "still-vex'd Bermoothes" (*Tempest*, i. 2. 229), the use of *vex* is somewhat poetic or archaic, as is the application of the word to the continued agitation of the sea. *Annoy* has a middle degree of strength between *tease* and *vex*; a feeling of *annoyance* is somewhat short of *vexation*. We may be *annoyed* by the persistence of flies, beggars, duns, suitors, picket-firing, etc. *Molest* is generally a stronger word in its expression of harm done or intended, including the sense of disturbing once or often; some wild animals will not *molest* those who do not *molest* them. The next four words have a homely force—*badger* being founded upon the baiting of a badger by dogs, and thus implying persistence, energy, and some rudeness; *pester* implying similar persistence and much small vexation; *bother* implying weariness and perhaps confusion of the mind; and *worry* implying actual fatigue and even exhaustion. *Plague* and *torment* are very strong by the figurative extension of their primary meaning, although they are often used by hyperbole for that which is intolerable only by constant return, as, a *tormenting* fly. See *exasperate* and *harrass*.

tea-tree (tē'trē), *n.* 1. The common tea-plant or tea-shrub. See *tea*, 2.—2. A name of various myrtaceous and other plants, chiefly of the genera *Leptospermum* and *Melaleuca*, found in Australia, Tasmania, and New Zealand. See phrases below. Very abundant and conspicuous, especially in New Zealand, is *L. scoparium*, the broom tea-tree, known also as *tea-scrub*. It is an erect rigid shrub, or in the mountains prostrate, from 1 to 12 feet high, forming dense thickets, with leathery sharp-pointed foliage, covered for two months with abundant small white blossoms. Its wood, though small, is hard and useful for turning, etc. *L. lanigerum*, the Tasmanian tea-tree (found also in Australia), is a somewhat larger, very abundant shrub or tree, with a hard even-grained wood. The leaves of both are reputed to have been used by Captain Cook or early colonists as tea, which may account for the name, but the native Australian name of the former is *ti*, *Melaleuca uncinata*, the common tea-tree, is a shrub, or sometimes a tree from 40 to 80 feet high, with hard, heavy, durable wood, widely diffused in Australia.

Even the grass itself is not indigenous, all these hills [in New Zealand] having till recently been densely clothed with a thicket of *tea-tree*, which is a shrub somewhat resembling Juniper or a gigantic heather-bush, its foliage consisting of tiny needles, while its delicate white blossoms resemble myrtle. It is called by the Maoris *manakau*, but the settlers have a tradition that Captain Cook and his men once made tea of its twigs; hence, they say, the name. It is, however, noteworthy that this plant is called *ti* by the Australian blacks, so it is probable that the name was brought thither by some colonist from the sister isle.

Dan. *teknisk*), < NL. *technicus* (cf. *technicus*, *n.*, a teacher of art), < Gr. *τεχνικός*, of or pertaining to art, artistic, skillful, < *τέχνη*, art, handicraft, < *τίκτειν*, *τίκτειν* (√ *τεκ*), bring forth, produce.] I. *a.* Same as *technical*.

It is only by the combination of the Phonetic utterance with the *Technic* and *Esthetic* elements that a perfect work of art has been produced, and that architecture can be said to have reached the highest point of perfection to which it can aspire.

J. Fergusson, *Hist. Arch.*, I, 39.

II. *n.* 1. The method of performance or manipulation in any art, or that peculiar to any artist or school; technical skill or manipulation; artistic execution; specifically, in *music*, a collective term for all that relates to the purely mechanical part of either vocal or instrumental performance, but most frequently applied to the latter. S. Lawer, *The English Novel*, p. 34.

2. Same as *technics*.

Technic and *Teleologic* are the two branches of practical knowledge, founded respectively on conation and feeling, and are both together, as *Ethic*, opposed to *Theoretic*, which is founded on cognition.
